LETTER OF TRANSMITTAL.

Tampa, Florida, July 1st, 1919.

HON. SIDNEY J. CATTS,  
Governor of the State of Florida,  
Tallahassee, Florida.

Dear Sir:

I herewith transmit to you the Thirtieth Annual Report  
of the State Board of Health of Florida.

Very respectfully,  
(Signed): C. T. FRECKER,  
President, State Board of Health.

REPORT OF THE STATE HEALTH OFFICER.

Jacksonville, February 28, 1919.

HON. C. T. FRECKER,  
President, State Board of Health,  
Tampa, Florida.

Dear Sir:

In order that you may comply with the requirements of the Statutes which make it obligatory for you to prepare for the Governor a report upon what has been done by the State Board of Health of this State for the last year—with such recommendations as may seem to you to be proper and necessary—a detailed report for 1918, is herewith submitted for your consideration and that of the other members of the State Board of Health.

INFLUENZA.

Only one severe epidemic has visited this State during the past year, the so-called Spanish Influenza and it was world-wide. This terrible epidemic with its complications and devastation, was visited upon Florida, last October and took its toll in sickness and death.

Jacksonville, being the gateway to this State, Influenza apparently made its first entrance into this State through this city. A telegraphic communication was received from the Surgeon General of the United States Public Health Service at Washington, October 8th, advising the discontinuing of all public gatherings throughout the State. On receipt of this telegram a hurried conference was held with the City Health Officer of Jacksonville, which resulted in the closing of all the schools and amusement places in Jacksonville, and a telegram was sent out from this Office, advising all our District Health Officers, as well as the mayors and city health officers of various towns throughout the State, to close all amusement places and schools

on account of epidemic Influenza. These measures were immediately carried out; city officials and county school officials appeared eager to co-operate with the State Board of Health in endeavoring to check or control the epidemic.

Our District Health Officers were released from their duties of special soil pollution work and were advised to devote all their time to combating Influenza, even going so far as to help attend the sick. Very soon our District Health Officers had more than they could do. Calls from various parts of the State came to the State Health Officer for assistance and relief, as there was a shortage of medical men in the State at that time due to war conditions. An appeal was made by the State Health Officer for volunteer medical aid throughout the State, and this appeal was answered nobly by more than a score of physicians who volunteered their services. Thus fifteen (15) extra medical men were made available and put on the active list, and under the direction of the State Health Officer, were sent out into parts of the State where assistance was most needed.

This action had the approval and co-operation of the United States Public Health Service, and these extra physicians were paid jointly by the State Board of Health and the United States Public Health Service. By a special Act of Congress an appropriation of One Million Dollars (\$1,000,000.00) was made to combat this epidemic throughout the United States, and Florida's share was used by the United States Public Health Service. The United States Public Health Service, acting through their Assistant Surgeon located in Jacksonville, did valuable service, and the State Health Officer appreciates this assistance and co-operation coming at such an opportune time.

The Statistician of our Department was advised to communicate by wire with all the State Registrars, requesting them to wire reports of all deaths due to Influenza and Pneumonia. During this epidemic daily telegraphic

reports of the number of deaths occurring from Influenza and Pneumonia were received by our Statistician, and this information was wired each day to the United States Public Health Service at Washington. We published in our Health Notes for November a chart showing graphically the number of deaths from Influenza and Pneumonia each day from October 5th to November 5th, 1918, as compared with same period in 1917.

By comparing the mortality list of October 1917, with the month of October 1918 (this being the month of the epidemic) it shows to what extent this disease (Influenza) prevailed in this State, and its frightful toll of death. For October 1917, nine hundred and eighty-one (981) deaths were reported. For October 1918, three thousand five hundred and seventy-seven (3,577) deaths were reported.

#### DIPHTHERIA.

The usual number of cases of Diphtheria did not materialize in the fall 1918, as was expected; no epidemic occurred during the year. Diphtheria usually prevails quite extensively during the late fall and early winter.

#### SMALLPOX.

Smallpox gave us less trouble than usual during the past year, and appears to be on the decrease. More vaccinations should be done among the school children. People are apt to forget about vaccination when there is no smallpox.

#### HOOKWORM.

Hookworm disease prevails quite extensively throughout this State. This disease should be combated at the source, as well as the curative treatment given. It is a well established fact that the source is soil pollution. Children who are treated and cured may become re-infected unless the sanitary conditions about the premises are improved.

Much time of our District Health Officers and Sanitary Engineer has been devoted to the prevention of soil pollution. The soil pollution campaign started in June 1917, and continued through 1918, with the exception of the time devoted to the Influenza control work. The Influenza epidemic interfered with the soil pollution work early in October and has been troubling us ever since. Soil pollution work is the work which aims at the prevention of more communicable diseases than any other one work, namely, Hookworm, Typhoid fever and Dysentery.

#### TYPHOID FEVER.

Anti-typhoid inoculation is recommended and used by all of our District Health Officers. We furnish gratis this serum to any physician in the State. On another page a list of the free distribution of biologicals is given, most of them are furnished free by the State.

Our system of disbursing the biological products has many commendable features in that it affords convenient places for quick distribution by not having to send to the Central Office for the preparations. It is a well known fact that the success in the use of these products is due to the early administration. The manufacturer bears the expense of sending out these products under our directions. The distribution of our biologicals by months and counties appear on another page of this report. The use of biologicals is on the increase, and we have increased the number of distributing depots.

#### PRESS SERVICE.

Our weekly press service has been continued as bulletins, but the newspapers are not publishing them as regularly as we hoped they would. This weekly press service is an important way of getting certain public health matters before the reading public.

During the Influenza epidemic when the people were looking for anything to read about Influenza, we had several weekly bulletins on Influenza, its control and how it is transmitted; also how to treat or what to do until the doctor arrived. We emphasized the fact that it was contagious and spread by personal contact; that crowds should be avoided and that the great danger from Influenza was its complications—especially Pneumonia. Every week during the epidemic and frequently since, we have had our press service on Influenza.

The State Board of Health was duly represented at the American Public Health Association held in Chicago, December 9th to 12th, 1918. The Influenza epidemic was made the most important subject for discussion and more was said about this subject than any other and by the most prominent Public Health men of the United States. Much was learned concerning the nature of Influenza, and much remains to be determined.

On the basis of the best data available, it is estimated that there were about four hundred thousand deaths from epidemic Influenza in the United States during the months of September, October and November 1918.

Among the points agreed upon by the best health authorities and scientists who have devoted much time and attention to this subject are the following:

Compulsory reporting, wide spread publicity and education, recognized administrative procedures, closing and prevention, or limitation of gatherings—or at least proper restrictions—especially prohibiting non-essential gatherings. A committee was appointed and charged with the duty of preparing a provisional working formula based upon facts and opinions gathered from papers and discussions at the meeting. A brief outline of the Committee's findings and their recommendations appeared in one of our December bulletins.

We have also laid great stress in our bulletins on

Typhoid fever, its prevention, immunization and how to immunize with the Typhoid vaccine, and also that the State Board of Health furnished this vaccine free.

Malaria and mosquitoes have been one of our chief topics, also the prevention of hookworms and rabies fully described.

In regard to Rabies a letter was sent from this Office asking the sheriffs of the different counties to co-operate with us in the control of this unnecessary and easily preventable disease by killing all worthless dogs running at large, and notifying the owners of other dogs the necessity of keeping them at home or under surveillance. Almost all the sheriffs responded—offering their assistance.

Smallpox is probably the oldest of all the historic epidemic diseases, and we have endeavored to show to the people through the press that smallpox can be absolutely prevented by vaccination. Every child should be vaccinated. It is surprising to know the number of children not vaccinated, going to school. Universal vaccination will banish Smallpox. Vaccination against Smallpox is furnished free by the State.

One of our weekly bulletins dwelt quite extensively on school examination and the importance of keeping a child who is ill from any cause away from school until it is definitely known that the sick child has not a communicable disease. School examinations are now being made by our District Health Officer.

#### PELLAGRA.

We have had numerous inquiries about Pellagra, and we have tried to explain that Pellagra is not a communicable disease and that it is caused by an unbalanced diet. Pellagra is really not a public health question. The improvement of sanitary conditions has no effect upon Pellagra.

#### HEALTH NOTES.

We have continued to issue Health Notes and endeavored to have them reach all the physicians of the State, as well as many laymen. We furnish a copy to any one requesting to be placed on our mailing list.

In the January 1918 Health Notes, Medical Inspection of School Children was taken up in full and described in detail, how to examine school children and what to look for. In the February number there is a good article on the Control of Venereal Diseases. In the May issue there are several interesting articles, namely, "Saving More Babies," "Control of Communicable Diseases," "Bureau of Diagnostic Laboratories," etc. The August number contains What the State of Florida Does Through Its State Board of Health, Typhoid Prevention and Cooperation are emphasized. September number was devoted to reprint of papers read at our Health Conference and known as Health Conference Number. The November issue contains articles on Sanitary Engineering, State Laboratories, Vital Statistics, Child Welfare, Communicable Diseases in Schools, etc.

We are interested in our Health Notes, and our intention is to get up larger (full 32 pages) and even more interesting numbers, issued less frequently, but making them one of our educational features.

#### HOSPITAL FOR CRIPPLED CHILDREN.

The Legislature of 1911 added to the duties and responsibilities of the State Board of Health by Statutes requiring corrective treatment for the indigent crippled children of this State.

This Hospital for Crippled Children is now located at Ocala under the management of Dr. E. Van Hood. Dr. Hood has done some brilliant orthopedic surgery and his kindness in having these crippled children so well cared for, and at times entertained, speaks well for his ability in such work. Your attention is called to his report.

## NEW BUREAUS ESTABLISHED.

During the latter part of the year a Bureau of Venereal Diseases was established, placing a competent medical man at the head to organize and do special venereal disease work in conjunction and co-operation with the United States Public Health Service. The United States Congress appropriated in 1918 a special fund for this work to be carried on throughout the United States. This fund was prorated to the different states according to population and Florida received Eight Thousand One Hundred and Eighty-three Dollars and Eleven cents (\$8,183.11) for her part in this special work. You, with other members of the Board, realized that this amount was not sufficient and very generously and properly added to this fund an equal amount or an amount not to exceed Twelve Thousand Dollars (\$12,000.00) per annum, in addition to the allotment made by the United States.

The Board very wisely created a Bureau of Education and Child Welfare, which is an innovation in Public health work in Florida. This being a special Department and only created during the latter part of the year (Sept. 8th) not much has yet been done, but much is to be expected. Dr. Grace Whitford heads this Department and she is capable of accomplishing much good among the children. While the chief feature of this Department is educational, we think, however, that all the departments are more or less educational.

Realizing that no department can succeed without the sympathy and co-operation of the people, this office recommended to county officials that a social worker, or visiting nurse be appointed in each county to assist in the examination of school children, and to do the follow up work. The counties of Lake, Orange, Palm Beach, Pinellas, Hillsboro and Brevard have made such appointments.

We hope that in creating the Department of Child Welfare and placing a competent woman physician at its

head, that it will be the means of helping this State to reach her quota in saving the lives of one hundred thousand children in the United States and that all children in Florida will be benefited.

## DISTRICT HEALTH OFFICERS.

We have eight full-time District Health Officers, and one part-time District Health Officer, whose reports appear in this Annual, to which your attention is called. These gentlemen have done excellent work and I believe their work has been satisfactory. Owing to the peculiarity of his work it is practically impossible for a District Health Officer's report to make a showing comparable with, and commensurate to his actual work in the field (district). In any one district there are many obstacles to combat. Often a District Health Officer has to overcome them single handed and alone. Aside from the great amount of technical knowledge involved in the successful performance of this work, it requires at times the utmost tact and diplomacy. A District Health Officer must be ever alert, constantly a watchman and at the same time a man of sufficient force to inculcate his ideas into the minds of people of various classes and stations in life. Judgment, diplomacy and tact are prerequisites, for he must not make mistakes and then have to reverse himself. Once on record he should stand by his guns, but he should never go on record until he is sure he is right. He must be equally capable of discussing the neighbor's offensive back yard with some irate house-wife and facing a mass meeting with an organized opposition to his plan of closing the school and picture shows—much is expected of the District Health Officer. It is not true, according to the popular idea, that physicians (doing regular practice) are qualified to do public health work. Public health work, as it is understood today, is not taught in regular medical colleges. There are few schools today such as Harvard, Universities of Michigan, Minnesota, Wisconsin and Ohio—and these only in the

last few years—that give a regular public health course and this as special work. Thus you will see that a District Health Officer, to be efficient, must be a specialist, or make this work a special work. It is for this reason that District Health Officers are required to give all their time and are not permitted to do private practice. This is also the reason that a Board of Medical Examiners was appointed to examine applicants for the position of District Health Officer, hence a special examination was held to fill vacancies.

These examinations have in part an objective—that is the applicant taking the examination must know or soon realize what he must familiarize himself with and become informed upon certain subjects pertaining to public health work. It should be realized more fully that public health work is special work.

During the year we had three resignations, namely, Dr. C. T. Young, Dr. J. E. Taylor and Dr. Hiram Byrd. Dr. Young was acting Assistant to the State Health Officer in the central or main office. Dr. V. H. Gwinn was called from the Jacksonville District to fill this position. Dr. L. T. Galphin was appointed District Health Officer, subject to approval by the Board, to fill the Tallahassee District made vacant by the resignation of Dr. Taylor. Dr. W. H. Bryan was appointed to fill the Jacksonville District.

At a meeting of the Board held in June a resolution was adopted compelling all applicants for District Health Officers, to pass a satisfactory examination before an examining board. The Medical Board of Examiners was then created consisting of three physicians whose duties were to examine all applicants for District Health Officers. At specified times, the Examining Board—making its own rulings and requirements—conducts examinations, and is required to recommend to the State Health Officer, the three applicants making the highest grades in examinations. The members of this Board are Dr. C. T. Young,

Dr. W. M. Rowlett and Dr. V. H. Gwinn. It was thought wise to have two members of this Board, physicians who were not connected with the State Board of Health. After adopting rules governing the examination, these rules being that all applicants were required to pass a satisfactory oral and written examination, and were also required to make an average of not less than 65 per cent, the Examining Board held its first examination in Tampa, August 30th and 31st. Dr. L. T. Galphin and Dr. John Keely, after passing a satisfactory examination before the Medical Examining Board, were recommended and appointed, the Board confirming the appointments at a meeting held September 6th.

The Miami District, made vacant in October by the resignation of Dr. Hiram Byrd, has not yet been filled.

The District Health Officers are required to make inspection trips throughout their districts, visiting all incorporated towns at least once a year, ascertaining the sanitary conditions and advising with the municipal authorities as to the necessary corrective measures for the protection and conservation of the public health. They are also at all times subject to call for special work, and detailed at any time, to any point in their district or elsewhere in the State, whenever and wherever the exigencies of the situation appear to require their services for the prevention and control of any communicable disease.

The following named physicians constitute our field force and were selected on account of their qualifications. The counties composing their districts are listed after their names:

## DISTRICT HEALTH OFFICERS DISTRICTS BY COUNTIES.

## THE LABORATORIES.

In 1917 the Laboratories examined 144 specimens of supposedly rabid animals, 76 were positive, 62 negative and six were doubtful or decomposed. Treatment was sent to 134, all of whom were reported as indigent, except about 27. There was one death (Duval County).

In 1918 the Laboratory examined 92 specimens of suspected rabid animals—43 were positive, 41 negative and 8 unfit for examination. Treatment was sent out to 78. 49 of these cases were indigent and 29 paid for their treatments. There were no deaths.

The following table gives the distribution by months and counties and the cost to the State and to the patients. The treatment referred to is based on the Pasteur prophylactic (preventive) treatment and is not used as a curative.

When rabies once develops there is no known cure, therefore the proper management is prevention. The prevention could easily be carried out if all ownerless and worthless dogs were killed and other dogs compelled to wear a license tag, and also to wear a properly fitted protective wire muzzle. This can only be done by legislation, and not by any rules of the State Board of Health.

"Bacteriology is now an old-established science, but despite the fact it has changed public health work even more than it has changed medicine or surgery,—and both of these it has completely revolutionized,—the public still clings to the belief that public health is a curious profession, absorbedly interested in cutting weeds in vacant lots ("to prevent epidemics"), in burying dead animals and suppressing noisome odors ("to prevent epidemics"), in inspecting plumbing and collecting garbage ("to prevent epidemics"). The "good" health officer according to the popular standard, still too prevalent, is he who keeps the streets clean and the back alleys neat, who falls into a rapture over a newly whitewashed outhouse and into a rampage if a pile of old bones is found under the cellar steps. Yet many of those who know better let these ideas alone, or even acquiesce in them, "to save trouble." Nevertheless it is expected that the carefully uneducated, or miseducated, public opinion will demand up-to-date action! Is it any wonder that the public insists on thinking, acting, and legislation to suit the theories of twenty years ago instead of the scientific knowledge of today?" (Quotation from New Public Health).

## ENGINEERING DEPARTMENT.

Your attention is called to the report of our Sanitary Engineer and his report on the Florida Tank Privy which is described in detail in Health Notes for August 1918. The following quotation from New Public Health may be interesting:

"The Public Health Engineer is not therefore, or, rather, should not be, merely what the popular imagination makes him, a man of sewer pipes and concrete; of water-meters, manholes and pumps. The New Public Health Engineer will be a man keen of eye to see those features in all community construction work which may conduce to greater exchange of discharges, a man who knows just what is needed for prevention of disease in such ways, and therefore can both provide adequate precautions and at the same time avoid unnecessary or excessive ones. The civil engineer has been defined as he who can do for \$1.00 what any fool can do for \$4.00. He is a physical economist. He insists on physical safety but within that limit knows best how to achieve the needed safety without undue expenditure. The Public Health Engineer, dealing with water supplies, sewage, disposal, etc., does just this thing. He guarantees sanitary safety, and within that limit he guarantees it for less money than the ordinary builder. Any keen student of infectious diseases can generally see the grosser faults in a supply which permit infection. The Public Health Engineer is a specialist. He sees these faults very much more quickly and surely; if they are intricate he has the skill and knowledge to disentangle them; and when he finds them, he knows how to correct them.

The Public Health Engineer is, or should be, much more than this, however. He is the only public health worker whose initial professional training necessarily makes of him a business man, in the sense of an administrator of operations on schedule time, and with economy of labor and expense. Those physicians who make good administrators in this do so because they learn it in administration, not because of initial professional training. This training of the Public Health Engineer makes him also the best man to supervise maintenance of public utilities, as well as to construct and equip them. Further,

the absence of training in mechanism and machinery so prominent in the training of most health officials, makes of the Public Health Engineer the only public health man who can deal properly with the many mechanical devices of modern building of the public routes of infection, on the perfection of which many lives often depend. The hypochlorite plant, the mechanical filter, the pasteurizing device are machines. However well a physician may understand the underlying biological principals, he cannot figure the pitch of a cog-wheel or find the reason of the filter 'loss of head' without infinite and wasteful effort, if at all.

"The Public Health Engineer is in public health what the surgeon is in medicine, the 'man of his hands,'—the actual operator. Whatever the physician may discover as surgically necessary to be done, it is the surgeon who must bring his skill and knowledge to bear upon the doing of it. So, although the epidemiologist, the vital statistician, the laboratory man must usually determine the sources and routes of disease, it is the Public Health Engineer to whom all must turn wherever and whenever those sources or routes are to be put out of action by physical construction or mechanical device, or when economic mal administration of public utilities is the real basis of the trouble, rather than a physical condition."

#### VITAL STATISTICS.

Dr. F. L. Watkins who was appointed Statistician March 1916, for this State, resigned March 23, 1918, and Stewart G. Thompson, D. P. H. of Kansas was selected to fill the vacancy, April 15th, 1918. Dr. Thompson was highly recommended and has given entire satisfaction in this work.

Mortality reports for 1918 are higher than 1917, the main reason, no doubt, due to the great epidemic.

The following quotation is given as an illustration:

"A recently completed analysis of the statistics of over ten million wage earners recently insured by the Metro-

politan Life Insurance Company, shows that during 1918 the mortality was higher by more than thirty (30) per cent than prevailed for 1917."

We believe that the time is not far off when this State will be admitted to the registration area of the United States and that the assertion that the healthfulness of Florida, at all seasons of the year is excellent, will be substantiated and maintained by statistical figures.

Your attention is called to the Statisticians report in his Annual Report.

#### FAIR EXHIBIT.

At the State Fair held in Jacksonville during the latter part of November, the State Board of Health had a very interesting exhibit, well displayed. This exhibit brought forth such favorable comment that we were requested to send it complete to the Fair held later at Live Oak. This we did, with the result that we were also asked to send it on to Marianna to the Fair held at that place in December, and since then it has also been sent to the Orlando Fair. Thus the people of the State generally have had opportunities to see our exhibit, and to become familiar with the different disease bearing insects, also to see the best methods of screening against flies, and the great importance of this, and of the septic tanks, which so materially aid modern sanitation in country districts.

#### HEALTH CONFERENCE.

In June 1918 an Annual Conference of Health Officers was held. This was a get together meeting of our District Health Officers and heads of Departments of the State Board of Health to outline and discuss the work laid out for the following year. This is always an interesting meeting and the second of its kind we have had.

During the latter part of July the City Health Officers of the State were invited to meet our District Health Officers here in Jacksonville at the State Board of Health

Building for a general conference August 1, 2, and 3. At the same time our District Health Officers were notified to be here at that time. The object of this meeting was to get all public health workers acquainted with our District Health Officers of the State and at the same time to have the City Health Officers understand the object and duties of State District Health Officers, and furthermore to get the sympathy and co-operation of all the City Health Officers throughout the State.

It was a pleasure to note the presence of physicians who were not public health officials, as well as a large number of city health officials. It was the consensus of opinion that this meeting was a success. Valuable papers were read and discussed; these papers were printed in our Health Notes of September issue known as Health Conference number.

The State Health Officer takes this means of expressing here to the various city health officials and physicians attending, his appreciation in helping to make the Conference a success.

#### RECOMMENDATIONS.

Permit me to suggest in this Report that some revised methods of admissions of physicians or "doctors" to practice medicine—including especially chiropractors—should come before the next Legislature. A most absurd advertisement appears in one of the local newspapers by a chiropractor warning against vaccination for the prevention of smallpox and typhoid, stating in plain English that:

"Chiropractors do not need to resort to such methods to ward off disease, as they remove obstructions so NATURE can do her duty and give the body power of resistance, and if any of these diseases should get hold, chiropractics is the surest and quickest way to get rid of it, because it assist nature to throw off the poison. Come in and let me explain it so plain that you can see the reasonableness of it. Always go to a real Chiropractor, and not a Mixer.

who does not know where to look for or find the cause of your trouble."

The Florida State Board of Health and all state boards of health in the United States; the United States Public Health Service; the United States Army and Navy recommend vaccination against smallpox and typhoid—in fact the best medical brains of the world recommend vaccination for the prevention of smallpox and typhoid, and here is a chiropractic advertisement that is allowed to mislead the common people by advising against vaccination. We should ask the Legislature to prevent such advertising. The State Board of Health was created by the Legislature and should be supported by the Legislature.

While the true function of the State Board of Health is to advise the people, the responsibility for public health conditions rests with the people. We feel that it is our duty to prevent "quack" advertising, as we do against any other public health menace.

The Press Service for February 26th, 1919, is inserted here following Recommendations, for the purpose of showing up "quack" advertising, in the hope that some legislation might be enacted which would regulate such advertising as may be misleading to the people.

Three quarters of a century ago Disraeli said in the British House of Commons: "Public health is the foundation on which rests the happiness of the people and the strength of the nation. The first duty of a statesman is the care of the public health."

#### PRESS SERVICE—STATE BOARD OF HEALTH OF FLORIDA.

Released Wednesday Morning, February 26th, 1919.

#### QUACK ADVERTISING.

In one of our prominent newspapers there appears an advertisement that condemns vaccination against smallpox and typhoid, starting off with such headlines: "Is It Possible That Thinking, Scientific People Would Do Such a Thing", and ending by stating: "If any of those diseases should get hold, chiropractic is the surest and quickest way to get rid of it."

This advertiment is so absurd that the State Health department would not notice it if its attention had not been called to it; further-

more it attacks vaccination, which the Florida State Board of Health recommends as do other state boards of health as well as the Army and Navy.

Is it possible that a chiropractor or any one else of ordinary intelligence believes that smallpox can be cured; moreover is it possible that any one, even if smallpox could be cured, believes it better to have the disease than to prevent the disease? Smallpox can be prevented and the prevention is vaccination. The Florida State Board of Health advises vaccination and furnishes vaccine free. It is the duty of Public Health officials to prevent epidemics if possible and it is possible to prevent epidemics of smallpox. Thinking people will not be affected by a quack advertiment, but the unthinking and uneducated may be. The State Board of Health is trying to bring home to the people of this State certain educational features that will be beneficial in the way of preventing diseases by improved sanitation and right living. Improvements in sanitation affect or control the spread of certain diseases, but this does not apply directly to smallpox—hence vaccination is advised.

It has been asserted by eminent authorities that vaccinia (cowpox) confers a more lasting and complete immunity against smallpox than does an attack of the disease itself, at any rate it represents the nearest approach to a perfect prophylaxis of which in all medicine, we have knowledge.

In the educational campaign of all state and city boards of health, it should be recognized that the quack advertisers, with their grotesque misrepresentations, are even as much of a menace to a community as is disease itself. There is no subject upon which the average man or woman is so ignorant as that pertaining to health and disease, so that with the natural and inborn yearning of the human soul in distress for some specific, some perfect cure, which cannot be offered by the conscientious physician (because it does not exist) they are easily led astray by the plausible Charlatan who "having none of the virtues can best assume them all."

In concluding this condensed report of what has been done in State Health work in Florida, during the past year, the Executive Officer wishes to express his thanks and appreciation to the President and other members of the Board for the confidence shown in the management of the Executive Office, and for the approval of his policies. The State Health Officer desires to thank his co-workers and express his appreciation for their support and co-operation.

Respectfully submitted,

W. H. COX, M. D.,

State Health Officer.

**REPORT OF JOHN KEELY,  
District Health Officer.**

Jacksonville, January 28, 1919.

HON. W. H. COX,  
State Health Officer.

Dear Sir:

I have the honor to submit the following report of my work:

I began my service with the State Board of Health on September 6th, 1918—being assigned to the Jacksonville District.

During these four months, I have been engaged in all of the ordinary duties of a District Health Officer; from the administration of Anti-typhoid vaccine, Diphtheria antitoxin, Anti-Pneumococcic and Anti-tetanic serums, Vaccine inoculations, and the actual treatment of disease; to those other prophylactic measures which may be included in "soil pollution" work and the examination of water (with the determination of its source and disposition).

I have enforced the screening of houses against flies and mosquitoes, and have superintended the eradication of insects and vermin.

I have swabbed several hundred noses and throats in my (often successful) quest of the "Klebs Loeffler" bacillus.

These, and various and sundry other activities have been assigned me, but by far the most important work that I have encountered was during the recent and distressing epidemic of Influenza; and with this I have been so intimately associated from its very inception and until even the present, that most of my time and energy have been expended in an effort to alleviate conditions surrounding this unprecedented local (and National) calamity.

It is unnecessary to dwell upon the numerical inadequacy of the practicing physicians throughout our State;

**REPORT OF DISTRICT HEALTH OFFICERS**

31

to refer to their magnificent battle against odds overwhelming or to their self-sacrifices and disregard of pecuniary gain when duty called. These things are matters of record and well known alike to laymen and to the profession.

It is also unnecessary to speak of conditions, at this time, in one locality as being better or worse than in another for they were bad enough everywhere, but surely the limit had been reached at "Hawthorn," when you (Mr. Health Officer) and myself were called there to assist the one local physician in covering an area of some thirty miles and in treating over one hundred and fifty patients, among whom were twenty-eight widely scattered pneumonia cases and all infected with a most virulent organism and many in a dying condition.

During the epidemic I have treated sufferers in Lake Butler, Macclenny, Live Oak, Branford, Lake City, Glen St. Mary, East Port, Arlington, Loretta and Panama Park, all within my own district; and at Burnett's Lake, High Springs, Fort White, Hawthorn, Dade City, Sanford and Jacksonville, without.

In every case, where it had not been done, I have closed schools, picture shows, etc., and I have assisted the local physicians in every way possible.

It has been my endeavor, and in this I have been greatly aided by the untiring efforts of Dr. V. H. Gwinn, to keep thoroughly abreast of the last word in the scientific world concerning this disease; and being in touch with practically all of the other State and many City boards of health, we have been able to impart their experiences and recommendations to the tired, and often discouraged, practitioners who had neither the time nor the opportunity for gaining such information.

I have tried to impress those physicians, who were disheartened by the apparent futility of all treatment, in some of these cases, with the fact that I stood back of them and

shared their responsibilities, and that I did so without incurring the slightest obligation upon their part or upon the part of the patient. This seemed invariably to have been a source of gratification and comfort to them.

In Jacksonville I treated many cases, (almost invariably pneumonias), the overflow of a number of the local physicians; and was on call, day and night at St. Lukes, St. Vincents and Riverside Hospitals. Was called in consultation by several physicians within the city of Jacksonville and by a great number without, and took care of five doctors in Jacksonville and elsewhere who were ill of this disease. In and around Macclenny I visited fifty cases, in and near Fort White, High Springs and Burnetts Lake over one hundred and fifty cases, in the neighborhood of Hawthorn one hundred and twenty-five or more (and many of these a number of times). At Lake Butler and Glen St. Mary I saw a number of cases, also at Live Oak, Lake City and Branford, and at East Port there were some fifty or sixty sufferers.

In Loretta, I found twenty-two school children of St. Joseph's Academy ill and in bed and advised with the resident physician as to quarantine and treatment.

At Arlington I found a distressing condition, there being about one hundred scattered cases and no physician (except the occasional visit of one of the overworked Jacksonville doctors). Here I visited and prescribed for, practically all of the sufferers and arranged for their future welfare.

Altogether to date, and including those in Jacksonville, I have visited no less than eleven hundred Influenza patients including at least one hundred and fifty pneumonia cases.

While there is much that we do not know concerning the nature of this disease, still there is much that we positively do know, and unless we utilize these facts to the utmost, we shall fail utterly in accomplishing anything.

Probably next in importance to the Influenza epidemic and certainly so in my district is the Hookworm problem.

In my examination of the school children in Baker County I found an amazing number thus infected and the condition obtains in all of my eight counties but to a lesser extent.

I have brought this matter to your attention and am familiar with your excellent plans for combating this great evil, in the near future.

Diphtheria has not appeared in epidemic form anywhere within my district during my service, although at Youngstown and Panama City (not in my district) I was sent to investigate and found that there had been several cases and with high mortality.

I have seen a few scattered cases from time to time at various places, but usually it has been limited to one and almost never more than two in any given neighborhood and with few fatalities.

The same I can say of Typhoid fever. The cases have been few and scattered and the mortality extremely low.

Scarlatina, Measles, Varicella, Pertussis and Parotitis have appeared at various places, usually confined to one, or more members of a household and never in serious epidemic form and with practically no fatalities.

No actual cases of Rabies, Cerebro-spinal meningitis, Infantile-paralysis or Variola have been brought to my notice, although several of the latter have been so reported, but in each of these cases I have been able to revise the diagnosis.

Malaria and Tuberculosis (in its various forms) I have not infrequently encountered, and I have given appropriate treatment and advice in every case.

Real "Trachoma" is present in perhaps a very low percentage of the school children whose eyes have been examined, but the relative frequency of Follicular Conjunctivitis, which cannot be distinguished from Trachoma (in its in-

ciency) has caused me to adopt the plan of sending all cases of Conjunctivitis to a specialist and not allowing those so affected to return without a certificate of discharge from said specialist.

No cases of Dengue or Pellagra have been reported to me although it is likely that some few of the latter do exist within my territory.

I saw one case of Leprosy which was brought up from Seminole County for diagnosis.

During my service with the State Board of Health I have delivered in various localities eight public addresses, and have directly caused the passage of seven city ordinances in as many cities.

I have made a thorough examination of two hundred school children in Baker County and have checked up and continued the excellent work of Dr. O. H. Cox (of the United States Public Health Service) upon the thirty-five hundred school children in Duval County (extra Jacksonville).

I would like to emphasize the imperative need of nurses and assistants if this work is to be carried on properly.

In conclusion, I wish to thank you and your entire staff for the cordial manner in which I have been received into your midst, and for the courtesy and encouragement that you have invariably shown me. With Dr. V. H. Gwinn, (Assistant State Health Officer) I have been most intimately associated in the routine of my duties, and his unceasing devotion to his work, his cheerful advice and friendly criticism have been my constant inspiration.

Through you I wish to thank Dr. B. L. Arms and his excellent staff of Laboratory workers for their many courtesies, and to commend them for the accuracy, celerity and general efficiency with which they have handled all of the work entrusted to them by me.

To Mr. George W. Simons and the members of the Sanitary Staff, I am indebted for their personal kindnesses

and efficient cooperation, and to Mr. S. G. Thompson, whose accurate and perspicuous reports of Vital Statistics have so greatly aided us all.

Respectfully submitted,

JOHN KEELY, M. D.

District Health Officer, Jacksonville District.

**REPORT OF GEO. A. DAME,  
District Health Officer.**

Inverness, Florida, January 27th, 1919.

Dr. W. H. COX,  
State Health Officer,  
Jacksonville, Florida.

My dear Doctor:

Herewith I beg to submit a report of my activities as District Health Officer of the district composed of the counties of Alachua, Citrus, Levy, Marion, La-Fayette and Taylor for the year 1918.

I have devoted some of my time to each incorporated town within my six counties and to nearly every village and rural community. A very considerable part of the year's work has been given toward arousing interest in the rural districts, using the country schools as centers from which to spread our health propaganda.

At the suggestion of the State Health Officer my efforts for several months have been concentrated within definite areas, and I wish to state that I am in thorough accord with this suggestion. I believe that the results obtained conclusively prove that it is better to take the work up by communities, do intensive work, complete the work contemplated, arouse such a community spirit for improvement that the work will continue under its own momentum and move on to the next unit. But while doing this intensive work I have not neglected other public health work in the other sections of my district.

The duties of a District Health Officer are so various and so extensive that it has not been possible always to follow up any one line of duty without multitudinous interruptions but insofar as possible my chief activities have been devoted to:

Child Welfare, Control of Epidemics and  
Intensive Sanitary Surveys, Educational Activities.

**REPORT OF DISTRICT HEALTH OFFICERS**

37

Minor activities have been: Abatement of nuisances, enforcement of public health laws, attendance at public meetings, conferences with city councils, promotion of a spirit of confidence among physicians and others in the activities of the Health Department and for several weeks during the terrible influenza epidemic, devoting from eighteen to twenty hours a day to the practice of medicine in towns and communities that were without physicians or nurses. This work, it is hardly necessary to say, was done without fee and at the suggestion of the State Health Officer at a time of great distress and panic among the people generally.

**CHILD WELFARE.**

This work for the year 1918 was in a rather chaotic condition in all sections of the State with a very few exceptions. This was due to several causes. Being a radical departure to most of our people and sometimes sadly misunderstood, they have to be educated to a proper appreciation of this work: What is to be done, how it is to be done and why we are doing it. Arrangements have to be made for proper follow-up work. The authorities of the different counties have to be shown that there is a popular demand for this work before they can be induced to include funds in their budgets for the payment of salaries of visiting nurses or social workers. These budgets are made in July, a time of the year when most school activities have ceased. I regret to state that I was unable to get any county in my district aroused to the point of having an officer of this kind appointed and as a consequence there was no follow-up work of any kind accomplished.

The situation for the year 1919 seems much more promising and I believe now that appropriations will be made in at least half of my counties for this vital need. However, I wish to report that the children in all the schools, white and colored, in two counties were examined last term. These counties being Marion and Citrus.

## INTENSIVE SANITARY SURVEY.

I consider this undertaking the most important and most necessary work promoted by the State Board of Health during the year. It strikes at the very foundation of disease in this State. Let the surveys be made as contemplated; let the data be collected and properly tabulated and the results be published to the people; let the proper laws then be passed as are indicated by the results of this survey; and then let these laws be enforced by all awakened and conscientious local authority and the death-rate from typhoid, hookworm, tuberculosis, malaria and intestinal diseases will show such a wonderful reduction that this State will take front rank in health and our people will never consent to drop back into their previous antiquated and indifferent methods and attitude.

There are no records in my office of the work accomplished in this survey previous to August 5th 1918. Briefly I will state that a large number of towns were investigated, many health ordinances were passed, public addresses were made, hundreds of inoculations against typhoid were given, hundreds of sanitary privies were built and hundreds of house survey cards completed. Many unsanitary premises and other nuisances were condemned and several specimens of water were taken and analyses secured.

Since August 5th my reports show that the following results have been accomplished and this, notwithstanding the great influenza epidemic and the performance of other necessary work.

Towns visited.....	8
Ordinances passed .....	2
Anti-typhoid inoculations given.....	675
Public addresses made .....	18
Privy notifications served .....	452
Privies actually built .....	724
House survey cards completed.....	584
Other condemnations .....	54
Samples submitted to Laboratory....	18

At the beginning of this survey one county in each district was designated as a starting-point. In my district Marion was selected and most of my survey work has been done within that county. The people of Ocala and of Marion county have taken a very intelligent and sympathetic interest in this work and have co-operated very freely. The city council of Ocala designated their sanitary inspector, Mr. G. W. Akin, as my assistant. I wish to commend him as one of the most efficient sanitary patrolmen it has been my pleasure to know.

## CONTROL OF EPIDEMICS.

During the year there have been three epidemics of typhoid in this district, the worst of which was at and in the vicinity of Oak in Marion county. The steps taken at that place are indicative of those taken at other points. I made a survey of the surroundings and made four definite suggestions:

1. That each residence be furnished with a sanitary privy.
2. That each residence be screened against flies.
3. That their water-supply be analyzed for possible contamination and properly safeguarded.
4. That the people be inoculated against typhoid.

Mr. Logan and Mr. Arnold of the McDowell Crate Company took the initiative in carrying out these suggestions and at the present time nearly every house has been screened and furnished with a sanitary privy. Arrangements have been made for an abundant supply of pure water and a very large majority of the people have been inoculated. The neighborhood is clear of typhoid for the first time in more than a year.

There have been other small epidemics of measles,

mumps, dysentery, whooping-cough and scarlet fever but none of these reached serious proportions and were soon brought under control.

Then comes the great influenza epidemic and I feel my inability to make a proper report. I must say, and let it suffice, that I devoted practically all my time and energies for not less than two months to the alleviation of sickness and suffering and to the use of every means available for controlling this disease.

At this time it is still very prevalent in my district but is showing a gradual diminution of frequency and of virulence.

#### EDUCATIONAL ACTIVITIES.

I have felt that one of my most important duties was in getting the public aroused to a proper appreciation of the efforts of the State Board of Health and in creating a demand for more and more health work of every kind, especially proper sanitation, child welfare and the control of communicable disease.

Usually my efforts have taken the direction of using newspapers for health articles; addresses to schools, city councils and other public gatherings; and in co-operating to the fullest extent with local organizations of public-spirited women.

I have found the newspapers always willing to devote their columns to the promotion of all good ideas for health improvement. The city councils are usually responsive to proper appeals to their patriotism and civic responsibility. As to the women of my district, especially as represented in their local clubs under whatever name, it gives me great pleasure to acknowledge their very efficient and very intelligent assistance rendered freely and unselfishly toward the establishment of proper ideals and agencies for the conservation of life and health.

I have received most loyal and enthusiastic assistance from Superintendents of Public Instruction, school teachers and principals of high schools.

Respectfully submitted,

(Signed): GEO. A. DAME,  
District Health Officer.

**REPORT OF F. L. TATOM,  
District Health Officer.**

DeFuniak Springs, Fla., January 1st, 1919.

Dr. W. H. COX,  
State Health Officer,  
Jacksonville, Florida.

Dear Doctor:

I beg to submit herewith a brief resume of my activities as District Health Officer for the western district of Florida, embracing the counties of Escambia, Santa Rosa, Okaloosa, Walton, Holmes, Washington, and Bay for the year ending December 31st, 1918. During the past year I have visited fifty towns and communities in this district, many of them were visited several times. On these visits in addition to the regular routine work of inspections I gave popular talks on Sanitation and Hygiene, whenever the opportunity presented.

The first half of the year was devoted to soil pollution work and a campaign for typhoid inoculation, both of which were highly successful and gratifying. Notwithstanding the high cost of materials and the scarcity of labor caused by the war, over four hundred sanitary privies were built in Bay county alone, principally in the towns of Panama City, Millville and Bay Harbor. The latter town being at this time one hundred percent sanitary, as far as privies are concerned. In the balance of the District there were built approximately two hundred and fifty privies, included in the number were thirty five sanitary privies installed at rural schools, besides a large number of sewer connections in towns having sewage systems. The campaign was not pushed in several towns contemplating sewerage projects for fear that it might operate against these projects when submitted to the people. In these towns frequent inspection and scavenger service was urged.

The campaign for typhoid inoculation was also highly successful, and I wish to extend my thanks to all of those physicians of the district who so generously cooperated in this work and contributed to its success. Practically all of the physicians of the district volunteered their services free of charge to administer the vaccine furnished free by the State Board of Health. As a result of this campaign approximately seven thousand eight hundred received this treatment free of cost, besides a large number who were inoculated by the public Health Service, and others who paid for their vaccine and were inoculated by their family physician.

During the past year I have met with the councils of nine towns discussing with them matters of sanitation affecting their communities. The following towns have passed sanitary ordinances recommended by the State Board of Health.

Chipley, Bonifay, DeFuniak Springs, Panama City, Millville, St. Andrews, Lynn Haven and Pensacola. Among several sanitary ordinances passed by the city commission of Pensacola was one of great importance, viz.: the installation of sanitary privies by the city with adequate provision for scavenger service.

At this writing bids are being advertised for the construction of twenty-eight hundred of these privies.

**COMMUNICABLE DISEASES—TYPHOID FEVER.**

During the past year typhoid fever has occurred in this District with its usual regularity but did not assume epidemic proportions except at Pensacola where it was quite prevalent during the months of May, June and July. During these months there were approximately one hundred and forty cases (only four cases reported by physicians up to June 1st) with fourteen deaths. An investigation of this outbreak by Dr. Deriveaux of the U. S. Public Health Service and myself failed to reveal any common

cause for the epidemic, most of the cases seemingly being caused by flies and personal contact.

The milk from one or two dairies were suspected of having caused some of the cases and were investigated but it was shown that no persons living in screened houses under hygienic surroundings using this suspected milk developed the disease.

Practically all of the cases were in the unsewered sections of the city in unscreened houses surrounded by open privies.

To combat this epidemic a house to house survey was made getting case histories and giving instructions for the proper disposal of the excreta, and information regarding modes of infection and methods for protection urging on the neighbors in the surrounding community the necessity for inoculation. The mornings were spent in this work and inoculations were given at the State Board of Health Laboratory in the afternoons, eight weeks were thus spent with the result that by the first of August, when the disease is usually most prevalent there were very few cases in the city. During this period more than five thousand persons were inoculated in the city of Pensacola.

#### OTHER COMMUNICABLE DISEASES.

No outbreak of other communicable diseases except Influenza has occurred in this district during the past year.

A few cases of Diphtheria have occurred from time to time but there has been no spread of consequence. Four cases of smallpox have been reported to me during the year. These cases were promptly isolated and the contacts vaccinated and there was no further spread of the disease. Several "sporadic" cases of scarlet fever have been reported but there was no spread to other members of the family or others, in any instance.

#### INFLUENZA.

This district together with the balance of the country has suffered severely from the dread scourge of influenza. A few cases began to make their appearance during the early part of September, but there was no spread of consequence until about the first of October, when it began to spread over the whole district like a prairie fire, leaving death and devastation in its wake. As soon as the disease began to assume serious proportions, I got in telegraphic communication with all parts of the district, that I could not reach personally and ordered the closing of all schools, picture shows, churches, and public gatherings of every description and I want to say that at those places where these precautions were taken early, that the disease did not assume nearly so serious proportions as it did at those places where closing was delayed until it obtained a firm foot hold. With these orders promulgated I threw off the mantle of Health Officer and assumed the role of general practitioner and went to work to assist in relieving suffering in those communities which were most in need of assistance, at which work I have been engaged since the first of October. During this period I have administered to more than five hundred cases of the disease, and have myself been twice a victim to it, suffering an attack of Pneumonia with the last attack.

At this writing Influenza is still prevalent all over the district but is of a much milder type than prevailed in October and November.

Respectfully submitted,

F. L. TATOM, M. D.

District Health Officer, Florida State Board of Health.

REPORT OF A. C. HAMBLIN,  
District Health Officer.

Tampa, Florida.

Dr. W. H. COX,  
State Health Officer, Florida State Board of Health.  
Jacksonville, Florida.

Dear Doctor:

In presenting this, my annual report for 1918, to the Florida State Board of Health, I am constrained to enquire the purpose of the District Health Officer and if I have executed the functions of that office fairly as I have met demands. Have I placed the proper value on my energies and my accomplishments? Have I been faithful to the trust in helping to build up a sturdier generation and cutting down that 38 per cent of "unfits"?

A BUSINESS.

Public Health work that protects and builds up is a business and does not differ in an economic or social way materially from other enterprises which are run by methods that yield dividends. The question of profit or loss must always be considered in the endeavor, not in dollars, so much, but in the accomplishment of an expected benefit to the people of that center for the expenditure of a certain amount of time and money.

METHODS.

All communities do not have common needs so our first effort is in making a sanitary survey, learning the Topography, Geography and Sanitary conditions existing.

Believing, as I do, that publicity, advertising if you please, to call it, is the method for early results in Public Health Work, and by condemning things that should not exist we sometimes arouse some of the people into discussion and exchanging ideas and forming opinions. This I call the stage of quickening. We then meet with the

city officials and talk ordinances along sanitary lines; then through commercial bodies, Womens clubs and societies we present our claims and ask for co-operation and financial support. Here the Press comes to our rescue and lends a helping hand. These people are all with us and prove to be our best friends. They all have my profoundest respect and thanks for the interest shown.

We are educating the people along lines of conservation. It seems human to look upon subjects that are being agitated as being the ones of prime importance, therefore, matters pertaining to public health should never be allowed to occupy a rear seat. I tell the people of things I find that should not be and they, as citizens, have the right to know, and the right to demand better conditions, cleaner markets, Dairies, and all places where food products are handled, and that those who handle these products should be free from the diseases that are communicable.

Today our people are having broader and clearer visions along lines of Conservation of health than ever before, and are demanding better conditions and higher standards in Sanitation and Cleanliness. And these expressions help those in authority to produce proficiency. I am very slow in trying to do work alone but through the assistance of the people I have found much saving of time and money by combining the strength of the various organizations.

Mr. Kipling very aptly expressed this position when he wrote:

"It aint the individual  
Nor the army as a whole  
But the everlasting team work  
Of every blooming soul."

Some one has said that knowledge which tends directly to preserve life is of most worth so I have wielded a strong arm against contagious diseases with special force along

lines of isolation and quarantine. We are passing through the Dark Age and beginning to see the light. Thank God, where people think children must have all the trunnel bed diseases, many fail to see any necessity for such and are taking their stand with us, demanding that children with communicable diseases must be kept in isolation and not be allowed to scatter broad-cast such disease.

The Medical Profession, I regret to admit, is our greatest hindrance along this line by their negligence in reporting every thing at once to the Health Department.

Another very important and, I believe, the most substantial branch of our work is the examination and teaching our teachers and school children. I have devoted as much time as practical to such work; teaching the children the danger of finger nails, teeth, drinking cups, towels, pencils, sanitation and the mosquito and have been very much gratified in some of my return calls to find a good part of it has been remembered and much of it put in practice.

In my old territory (and I have done but little in my new) I had 28 incorporated cities and about the same number not incorporated. In all of these centers I have made sanitary surveys. Have looked to the water supply, sewer system, sewage and garbage disposal privies, stables, dairies, cooling and bottling rooms, Soda fountains, restaurants, hotels, grocery stores, fruit stands and lunch counters, giving copies of State Laws and offering advice and suggestions as to screening, cleanliness, sanitation and sterilization.

In this work your Sanitary Engineer, Mr. Simons, has been a great help to me in getting ordinances passed and advice on water supply and sewage disposal matters. I have seen completed and doing the work well in two of our cities, incinerating plants caring for all the waste for these cities. Have extended sewer lines and water mains in four cities making about 300 house connection with

sanitary closets. I have one city with water and no sewer completely connected by Septic Tanks in every house and the city limits extend far out so as to take in the suburbs. I have several cities completely cared for by sewer and pit privies, some are entirely cared for by dry pit and others by the can and bucket plan.

### SCHOOLS.

I have met with all my school boards and Superintendents of Public Instruction urging the building of fly-proof pit privies at all rural schools and many have been built. All our better school buildings are being supplied with Septic Tanks. I have, during the year, seen completed about 500 sanitary toilet connections with sewer, 700 Florida tank toilets built, about the same number of dry-pit privies, and 100 Septic Tanks connected.

When the War Department selected Arcadia for Aviation Fields without waiting to consult the Home Office I at once began a survey of the city and suburbs and by the help of your Engineer was able to have ordinances passed caring for sanitary conditions, fly-breeding places, draining of the lower lands, abolishing stables that were unsanitary and governing restaurants and lunch counters, obtained permit to buy material for the extension of water mains and sewer system.

We established an extra Cantonment Zone including in that district the neighboring towns. We soon found that by this work other towns in all sections of my district were stimulated to making their own conditions better. We have seen a little leaven leaveneth a considerable territory.

About our shipbuilding plants, we have done some ditching, draining and oiling of the water in our fight against the mosquito, in addition to fly and lunch counter protection.

## FLY AND MOSQUITO.

In some of our cities we have sprayed with Fenole solution for the killing of flies on streets, alleys, stables, dumping grounds, about Hotels and Restaurants, but have laid greater stress on the destruction of the breeding places. I have not said so much about killing the mosquito, but have advocated the screening of water tanks and barrels, cleaning ditches, draining ponds, oiling streams and stagnant water by the drop method and the Knap Sack spray. I have not mentioned the treatment of typhoid and hook worm disease but have preached inoculation and the building of pit fly-proof privies as preventive measures.

Respectfully yours,

A. C. HAMBLIN,  
District Health Officer.

REPORT OF W. H. BRYAN,  
District Health Officer.

Dade City, Fla., February 1st, 1919.

Dr. W. H. COX,

State Health Officer,  
Jacksonville, Florida.

Dear Sir:

I herewith submit report of my work as District Health Officer from April 15th, 1918, to date.

During the first month of my service I was engaged in doing sanitary survey in the Lackawanna District of Jacksonville and around the S. A. L. Shops where conditions were simply abominable. This section being outside the city limits of Jacksonville and without police or sanitary attention from the City, and very low and flat with open privies, was a constant source of infection for hookworm, Typhoid fever and other filth born diseases. The S. A. L. Shops with eight hundred to one thousand workmen, were without toilet facilities other than two large incinerators. These were as much as one-fourth mile from many of the workmen's stations and the open box cars and toilets in old unused passenger cars were used by the men and as a consequence the tracks were, in places, covered with filth, making it most unsanitary. This condition had not been remedied when I left Jacksonville District in September. However, many of the private homes in Lackawanna District had provided earth toilets of an approved type, and the S. A. L. officials had promised to install an up-to-date sewer-system.

The month of May was spent in Hamilton County doing sanitary survey at Jennings, Jasper and White Springs. In these towns I found the same degree of carelessness and apathy among the citizens and officials in regard to sanitary matters, notwithstanding there had

been a serious epidemic of bacillary dysentery in the Northern part of the County a few weeks prior to my visit there and many children had died. I found the sewer-system of Jasper discharging raw sewage into an open stream.

The wet weather in Spring was favorable for contamination of the wells in Hamilton County and can easily account for the outbreak of dysentery. Screening laws were being ignored in every town in Hamilton County and flies had full liberty to spread any and all sorts of infection. I had many places screened and some closed.

The month of August and up to September 10th, was spent doing sanitary survey in North-east Springfield, Panama Park, Fernandina and Callahan. In these places I found many people disregarding the simplest rules of sanitation and in Fernandina found two-hundred and fifty open privies and eighteen cafes and boarding houses unscreened.

Between May 15th and September 10th, when I left the Jacksonville territory, I visited all incorporated towns and several unincorporated villages in that District, meeting officials and discussing sanitary and health matters, personally and at meetings of City councils.

There were no serious epidemics in Jacksonville District during my service there, except the outbreak of bacillary dysentery in Hamilton County and a few cases of typhoid fever in North-east Springfield section of Jacksonville and a few cases of fever at Stark. Diphtheria was reported from Macclenny, where upon investigation I obtained history of three cases in widely separated homes. I also saw one case of Scarlet fever in Lackawanna district of Jacksonville. I am sure that the prompt use of anti-typhoid vaccine prevented serious outbreak of typhoid fever in the North Springfield section as conditions there were very favorable to the spread of the disease. Before

leaving this section however, we instituted and had accomplished very gratifying sanitary reforms.

Since September 15th, when I was transferred to the District composed of Lake, Orange, Sumter, Osceola, Polk, Pasco and Hernando Counties, I have with the assistance of my patrolman, Mr. Andrew Law, made sanitary survey of Dade City, Zephyrhills, Brooksville, Kissimmee and St. Cloud.

In Dade City I found one hundred and fifty-seven families using open privies and drinking water from open wells. Among these one hundred and fifty-seven families I obtained history of fifty-two cases of colitis and bacillary dysentery and sixty cases of fevers, (malaria and typhoid). Among one hundred and twenty-seven families drinking hydrant water and using sewers or septic tanks, I obtained history of five cases of colitis and nineteen cases of fevers. In Brooksville the proportion of these diseases was about the same as in Dade City, where open wells and open toilets were used and is evidence to my mind that open wells and open privies are largely responsible for the prevalence of bowel troubles and certain types of fevers in our State during the Spring and Summer months, as a large per cent of open wells are contaminated with colon bacillus. In this territory since September 15th, I have visited all incorporated towns and have investigated diphtheria reports from Fort Meade, Wildwood, Leesburg, Winter Haven, Dade City and Winter Park. These were all sporadic as far as I could learn and only one case, that of a fourteen year old boy, at Fort Meade proved fatal.

I have seen one case of confluent smallpox at Eustis of unknown origin. One case of typhoid fever at a saw-mill settlement in Polk County.

On October 9th, influenza was reported at Kissimmee and I saw the first five cases there, all of which were contracted on railway passenger cars or at least gave history of railway travel within sixty hours prior to onset of the disease.

On October 18th, I was ordered to Dade City to do missionary work in the treatment of patients suffering from influenza and treated about two hundred patients, eight of whom developed pneumonia and one died. On October 26th, I was attacked with influenza and disabled to November 15th, when I resumed my duties as District Health Officer.

Since coming into the service I have inspected the jails in every county in the two Districts which I have served and desire to call the attention of the State Board of Health to the fact that many of these jails are without any means of heating whatever and consequently are very unsanitary as the inmates are obliged to sit in damp cement floored cells for days at a time. Often inadequately clothed and they fall easy victims to pulmonary diseases. It is a notorious fact that if influenza enters a jail a large majority of the inmates contract it and many die of pneumonia. Many jails and small convict camps are unscreened. The jail at Kissimmee is in Basement of Courthouse, only about four feet above water level and entirely devoid of heating facilities.

Dairies are universally filthy and small towns have no laws governing the sale of milk.

In many of the small country schools there are no facilities whatever for the public to bathe their hands and many have no source of water supply other than a neighboring well or pump and I found one school in Hernando County where the public were carrying water one mile. Might not some rule be passed requiring the School Boards to provide an adequate number of basins for these pupils and a water supply on school grounds? I am often at a loss how to handle these matters in the absence of any rule or law, although I am asking Boards of Education to give more attention to them when I have opportunity to meet the Boards personally. Negro schools in most towns are very insanitary and a menace to the health of the communities in which located.

I find many of the railway stations without adequate toilet facilities. Some have open toilets a long distance away, others have nothing and I know of no rule or law requiring them to provide such conveniences for passengers and patrons. However, I have condemned many of the open privies and refuse to accept any substitutes except a flush toilet inside the depot.

Examination of school children over a limited area of my District reveals many cases of hook-worm infection and consequent loss of mental and physical vigor among the young people of our State. As a rule, however, parents respond to our efforts to help them and only need to be reminded that constant vigilance is necessary to the eradication of these pests.

Respectfully submitted,

W. H. BRYAN,  
District Health Officer.

**REPORT OF L. T. GALPHIN,  
District Health Officer.**

Tallahassee, Fla., January 27, 1919.

Dr. W. H. COX,  
State Health Officer,  
Jacksonville, Florida.

Dear Doctor:

I herewith submit my report for the year 1918, beginning April 1st, when my duties as Health Officer began.

To familiarize myself with my District, I spent this first month in visiting the larger towns, and when possible, meeting the Mayors, Councilmen and Physicians in each.

During the latter part of May, I was called to Chattahoochee, as there was an outbreak of small pox at the Hospital for the Insane. On arrival, I found one of the Physicians, one colored attendant, and two colored patients afflicted with the disease.

There being no isolation hospital there, it was several days before one for the white, and one for the colored patients, could be improvised. As this all happened at such an inopportune time, the Superintendent and one of the Physicians being away on official business, I remained at the hospital until they returned.

The Hospital being a State Institution, was immediately placed under quarantine. Upon investigation, it was found that the disease was introduced into the Institution, by one, who, living some miles out in the country, and being afflicted with the disease at the time, visiting his brother, a colored attendant at the Hospital, while so afflicted.

All patients and employees were immediately vaccinated, also the families of the employees, who reside in Chattahoochee, and so only one other case developed, all being of moderate severity, with no fatalities.

**REPORT OF DISTRICT HEALTH OFFICERS**

57

In June, I attended the Annual meeting of the District Health Officers, held in Jacksonville, and again in July, I attended a meeting of the City Health Officers of the State, also held in Jacksonville, and from the papers read at each, and the discussions of same, gained information that has been of great help to me in my work.

During the month of June, I began an intensive sanitary survey of Jackson county and I am putting it mildly when I say that it certainly needed it. At the beginning, I not only received no co-operation, but considerable opposition, but by repeated conferences with the Mayor, and members of the City council, finally broke down that opposition, and later, received a great deal of encouragement and aid from all.

On account of the war, labor, and material for the construction of sanitary work, were almost out of the question, but finally the latter was secured through Government aid, and had not the Spanish Influenza invaded the country in such epidemic proportions just at this time, great changes for the better would have been made throughout the county along sanitary lines.

In the early part of October, the Influenza having spread so extensively over my District, I was instructed by the State Department to render such aid as I could, and Quincy, in Gadsden county, being in my estimation, the place mostly in need of help, went, and remained there until the epidemic was over in that district.

On my arrival at Quincy, I found four of the five local Physicians confined to bed with the "flu", and the remaining one, almost exhausted, and with 1200 cases of "flu" in town, and immediate vicinity.

Shortly after leaving Quincy, the only Physician at Port St. Joe, having been stricken with the disease, leaving the town without medical assistance, I was instructed to go there, and took charge of him and his practice, until such time as he was able to resume his duties, after

which I was sent to Sneads to assist the Physician there, as he had almost broken down from overwork, on account of the large number of influenza cases in his neighborhood requiring so much of his time.

During the Summer and Fall, I saw several cases of small pox, typhoid fever, and diphtheria in Quincy and vicinity, a few cases of typhoid fever occurring in Jackson, Leon, Walkulla, and Jefferson counties, also three cases of scarlet fever in Gadsden county but as all precautions were taken to prevent a spread of these diseases, none occurred.

The Medical examination of the school children, for obvious reasons, was late in beginning this year, and a report on this important work, is not attempted, as it has so recently begun.

Respectfully submitted,

L. T. GALPHIN, M. D.,  
District Health Officer.

# REPORT OF H. O. SNOW, District Health Officer.

Tampa, Florida, January 1st, 1919.

Dr. W. H. COX,  
State Health Officer,  
Jacksonville, Florida.

Dear Doctor:

I am enclosing my report for eight months of 1918 as per your request. Detailed reports of my activities as District Health Officer are already on file in your office, and this is a summary of the whole of them.

Respectfully,

H. O. SNOW.

Tampa, Florida, January 1st, 1919.

## SCHOOL INSPECTION.

During the year I examined a number of school children in each county in my District. This work extended over quite a period of time and was done when the demands of my work did not have me occupied otherwise.

One of the most glaring defects I found among the children I examined, was defective or rather decayed and neglected teeth. It is truly pitiful to see the absolute disregard of dental needs and to see children of school age with their permanent teeth, in a great many instances, decayed beyond repair. I would respectfully recommend that some steps be taken to train teachers to teach oral hygiene and to form tooth brush classes. This will at least direct attention to these defects and will, in some instances result in having needed dental work done, as well as serve to prevent decay of the teeth. It seems to me that something should be done to furnish dental service where people cannot afford it.

I found quite a few children with defective sight in one or both eyes. Eyes were tested with Snellin's cards furnished from your office. A number of cases of Follicular Conjunctivitis and some cases of Trachoma or granulated lids were found and treatment recommended. Some of these cases were treated, but without some method of follow-up work, very few cases of any kind, receive attention. When children have Trachoma, I think they should be excluded from schools until effectually treated as I was able, in some schools, to trace a family of children through the different grades by this affection of their eyes, which accentuates the fact of its infectiousness.

Adenoids and enlarged tonsils were found in a great many of the children and proper treatment recommended.

In rural schools, the prevalence of hook-worm infection was very marked. From a clinical standpoint, the per cent of those infected ranged from 60 to 100. I remember one school particularly, in Lake county, where there were about ninety children in it and from symptoms present, am quite sure there was not a child there who was not a victim of this infection.

The establishment of the Bureau of Child Welfare will doubtless enable the Board to relieve a great deal of these remedial defects and infections and will prove of great benefit to the children of school as well as pre-school age, in this State.

I was fortunate enough to get the School Boards in several of the counties of my District, to see the need for proper examination of school children and to agree to employ school nurses to assist in the work and to follow up cases and urge treatment for those who need it.

It was my privilege to attend and assist in Better Babies Contests in Tampa, Ybor City, Plant City, Orlando and Brooksville. This is undoubtedly great work and should be encouraged in every way possible. I was able to help in a number of these places and could readily see

the good accomplished. The interest of the general public was very marked in most of these places, and resulted in having a great many defects, which were minor in young children, but would prove to be a very serious handicap in later life, remedied.

#### SCHOOL SANITATION.

The sanitary conditions of a great many of the schools, as to outhouses, was very bad. No effort seemed to have been made to comply with the law requiring proper sewerage disposal. These defects were remedied, when pointed out to the Trustees, in a majority of cases. One county, Pinellas, having sanitary privies of the L. R. B. type in each school in the county. Ventilation and lighting defects were found in some instances and pointed out to the proper authorities.

The crusade against the use of the common towel and drinking cup was carried on and in the urban schools, a great many drinking fountains have been established. These, of course, are out of the question for rural schools.

#### MUNICIPAL SANITATION.

I visited practically all of the towns and cities in my District and conferred with the Mayors and Councilmen in reference to proper sewerage disposal and was successful in having several hundred sanitary privies installed, some of the L. R. S. and some of the pit and can types. Garbage disposal was taken up through Mr. Geo. W. Simons, Chief Engineer of the Board of Health, and he took care of that and the problem of water supply of several cities in this District.

#### EPIDEMIOLOGY.

There were about 40 or 50 cases of small pox in my District, most of them either sent to the isolation hospital, or isolated in their homes. Several hundred of those ex-

posed were vaccinated by me or at my suggestion. None of the cases of small pox proved fatal, though several of them were confluent in type. I would respectfully suggest universal vaccination of school children and adults where it can be done.

There were six cases of epidemic Cerebro-Spinal Meningitis, diagnosis confirmed by spinal puncture, none of whom died. The source of the infections could only be surmised as they were rather isolated cases. One case, a negro boy about fifteen years of age, developed it while at work constructing one of the aviation camps, at Arcadia. I immediately notified Dr. Hamblin, the D. H. O. there. All of these cases received Flexueis serum intra-spinously as early as the first twenty-four hours, when practical, but one case did not get his first dose until five days after his initial symptoms, and had doubtless begun to form anti-bodies for himself prior to its administration.

I saw two cases of Anterior Polio-Myelitis in 1918, both of which recovered. Neither of these received serum, as early diagnosis was not made, it being very difficult in isolated cases to make a diagnosis prior to the paralysis.

I saw a number of cases of Diphtheria and had three very persistent cases of carriers develop. Was, however, enabled to assist their physicians in rendering them non-infectious and after several negative swabs were sent to the Laboratory, they were released.

There were quite a few cases of Typhoid Fever in my District. I visited most of these cases and saw that proper disposal was made of excreta and succeeded in having a number of people immunized. In one instance, I succeeded in tracing the source of infection, it being water bourne. Had the wells closed and contamination of new water supply guarded against by proper sewerage disposal.

## DAIRY INSPECTION.

I inspected a number of dairies, the majority of which were not managed in a sanitary manner, due, in the majority of instances, to lack of knowledge.

I would respectfully suggest the needs of a Bureau of Dairies under the supervision of this Board, or some other one, as numbers of children lose their lives on account of drinking contaminated milk, or become infected with Tuberculosis due to the lack of knowledge or the wilfull use of milk from tubercular cows. The average dairyman seems to have no conception of what sanitation means, and some of them do not even use a sufficient amount of clean water for utensils, hands, etc.

Respectfully submitted,

H. O. SNOW,  
District Health Officer.

REPORT OF A. W. UNDERWOOD,  
District Health Officer.

Dr. W. H. COX,  
State Health Officer,  
Jacksonville, Florida.

My dear Doctor:

I have the honor to submit the following report of my activities during the past year.

I have attempted to continue during the past year the same constructive program that was outlined during the first six months of my employment by your board.

Realizing that it is a campaign of education and one of slow growth, requiring persistent effort, I have striven to accomplish the desired end by bringing into play all the activities that could be obtained to further my aims.

To this end I have in so far as was possible worked in and through the Municipal Authorities from whom I have received the most hearty co-operation and assistance.

St. Augustine, through the advice and counsel of the State Board of Health, has eliminated all open and unsanitary toilets and arranged to have all human excreta disposed of in a sanitary manner.

Palatka has passed an ordinance covering the same ground but owing to conditions arising from the war it was impossible to have the provisions of same complied with, but it is expected to have the improvements under way and carried to completion at an early date.

The other portions of my district are awake to the importance of the need of having sanitary surroundings and are extending every inducement to have same carried out and giving of their time and counsel to bring same to a successful conclusion.

I have spent considerable time in the examination of school children, giving them counsel as to the best course to pursue to overcome the deficiencies arising from phys-

ical defects and in all cases holding a conference with those in control that it might prove to be of permanent benefit.

The results have been so marked that it has encouraged us to make greater efforts in the year to come.

There have been no serious outbreaks of disease in my district during the past year other than Influenza which fortunately has been rather mild in its manifestations.

The State Institution for the Deaf and Blind, being situated in my home town, I at once on the first appearance of the Influenza in our midst, assumed charge of the institution and with the most careful attention prevented its entrance into the school.

The coming year promises to be one full of hope and I am looking forward to one of greater accomplishments not only of, improved sanitary conditions but of greater interest in sanitary living by our people.

Ever grateful for the assistance so freely given by yourself and the other members of the Board and hoping for a continuation of same in the year to come.

I remain Yours most Respectfully,

A. W. UNDERWOOD,  
St. Augustine, Florida.

**REPORT OF DR. WILLIAM R. WARREN,  
District Health Officer.**

Key West, Florida, February 10th, 1919.

Dr. W. H. COX,  
State Health Officer,  
Jacksonville, Florida.

Dear Doctor Cox:

I have the honor to submit the following report of the District Health Officer, for the islands of the Key West Extension, for the year 1918.

During the past year Monroe County has been fortunate in having few cases of communicable disease within its boundaries, and but for the invasion of influenza, the morbidity and mortality rates would have been remarkably low.

The increase of the population of Key West by the addition of men in different branches of the United States Service, together with the families of the men stationed here, required watchfulness on the part of the health authorities, and the necessity for vigilance was early appreciated by the Government, State and Municipal officers. As a result, those in a position to know, are fully aware of the improvement in both sanitary and moral conditions.

The Navy Department under the supervision of Admiral Fletcher, Commandant of the Seventh Naval District, ably assisted by his District Sanitation Officer, Doctor G. M. Guiteras, have been alert in sanitary matters and their efforts and cooperation have been productive of results that are very evident.

Systematic inspection of the entire city, with a view of eliminating the sources of disease and nuisances, was inaugurated and has been continued. The cooperation of the State and City was requested and was given. The City council passed ordinances requiring screening of all water containers and cess pools, the daily collection of

garbage, and provided penalties for violation of the ordinances.

Oiling of cisterns and other water containers, holding mosquito larvae, was regularly and systematically carried on by squads of men, which materially abated the mosquito nuisance.

The vigilance so exercised is probably responsible for the fact that there have been no fatalities among the enlisted men stationed here, from communicable diseases, other than influenza.

Influenza first made its appearance among the Navy personnel at the Training Station and in the United States Marine Hospital.

The disease was brought to the Training Station by recruits from the North, and the cases at the Marine Hospital were taken from passing merchant ships, the disease having been contracted in north Atlantic ports.

Of the first twenty deaths occurring in Monroe County, fourteen were among men in the service of the United States Government and six were civilians.

There were seventy-nine deaths from influenza in Monroe County during the year 1918. Of this number forty-four were civilians and thirty-five were in the United States Government Service. Sixty-nine died in the month of October, nine died in November and one died in December.

It is estimated that twenty per cent of the entire population of Monroe County had influenza during October, November and December.

Typhoid Fever:—Nine cases were reported during the past year and there was no deaths.

Scarlet Fever:—Two cases reported, no deaths.

Small pox:—No cases reported.

Malaria.—Three cases were reported and one death as a complication. All of the cases were imported.

Measles:—There were about fifty cases reported during the year, and there were no deaths.

German Measles, Whooping Cough and Mumps were reported in mild form, with no fatalities.

Diphtheria:—Eight cases were reported during the year with no deaths.

Leprosy:—There are nine cases of Leprosy on the island of Key West, under the supervision of the State and City Health Authorities. There was one death from Leprosy during the past year.

Acute Poliomyelitis:—One case of this disease was taken from a U. S. Patrol boat and immediately isolated at the Marine Hospital, the patient recovered.

Tuberculosis:—There were forty-seven deaths from tuberculosis during the past year. It seems almost unbelievable that fifteen per cent of deaths here should be caused by a preventable and curable disease. In a city that boasts of a climate unsurpassed, where sunshine is a daily visitor, where all can spend their hours of recreation and rest in the open, something should be done by the City and State to educate the people and prevent such an economic loss.

I take this opportunity of expressing my appreciation of the aid and cooperation rendered me by the State Health Officer and his assistants during the past year.

Respectfully submitted,

(Signed): W. R. WARREN,  
District Health Officer.

REPORT OF GRACE WHITFORD, M. D.  
District Health Officer.

Tampa, Florida, February 13th, 1919.

Dr. W. H. COX,  
State Health Officer,  
Florida State Board of Health,  
Jacksonville, Florida.

My dear Doctor Cox:

The Bureau of Education and Child Welfare has been established slightly over five months. During that period my duties have taken me into the following counties: Leon, Escambia, Broward, Palm Beach, St. Lucie, Brevard, Pinellas, Hernando, Hillsboro, Lake, Duval, Marion, Orange, Volusia, Lee, Putnam, Suwanee, and Seminole. These counties have either needed my services most, showed greatest interest and co-operation, or have had workers employed who required direction. Few counties in the state have failed to evidence an interest in the work or to ask for the service of the Bureau.

We have had the honor of having with us two leaders of national importance in the work for children: Mrs. Max West, of the Federal Children's Bureau in September, and Dr. Jessica Peixotto, Professor of Social Economics in the University of California, and Chief of Child Conservation, Field Division, National Council of Defense. Both left inspiration and continue to give practical help. To the organizations which they represent we are indebted for much of the literature that we use.

Practically the whole state is districted with Child Welfare chairmen, either from the Florida Federation of Women's Clubs or women of the Field Division, Florida Council of Defense, making possible work that this Bureau, with its limitations, could not cover, even with a large budget. We are greatly indebted to both bodies of women.

The pre-natal work of the Bureau is as yet largely confined to the distribution of literature, newspaper publicity, lecture work, and the attempt to interest communities in the establishment of small maternity hospitals or maternity wards in larger institutions. A plan for a registry for expectant mothers, and for "birthday" letters for the first five years of the Florida babies' lives, has been formulated, but must await an adequate office equipment before being put into operation. Education of the colored mid-wife is a grave necessity; classes have been formed in several centers for these women, and local registrars are showing some remarkable figures as to their effectiveness. Nearly every county shows good "follow-up" work succeeding Spring or Summer pre-school age clinics. It has seemed wise to postpone many of the second clinics scheduled for six months after the first, because of Influenza. Lake County has just finished her second examinations. One half of the children had not been reached in the first clinics, and one half of those who had attended the first examination, had had, or had attempted to have, corrections advised made. We now have one county completely districted with infant welfare stations to which the visiting nurse makes scheduled visits. Infant Welfare Stations have been established in Tampa and Jacksonville with a milk depot in connection with the latter. Several committees are supplying needy babies with free milk. Orange County has just appointed a social service worker and Hillsboro, a visiting trained nurse. In addition, social service workers have been employed for some months by Brevard, Lake, Palm Beach counties, and a visiting nurse each by Dade and Pinellas counties; seven in all. Other counties are anxious for such a service, but will have to wait for their County Boards to make up their annual budgets. Some of our cities have whole or part time nurses. This type of woman is, perhaps, our greatest need throughout the state in every county.

As you know, physical examinations for school children are being held in each district of the state. The record cards used are those devised by this Bureau, giving the possibility of a record of twelve years for school life. There were over 185,000 children in the public schools before Christmas; several thousand have been added since through the tourist population. It seems well to make a complete inventory of our most valuable material in this way; after that is once done a less time consuming method can be substituted. Where the work is conscientiously done, perfect co-operation is given by the school patrons and authorities, and the teaching body. My own school examination work has been in Leon and Pinellas counties. I hope to finish in the latter completely myself. Again, the visiting nurse, or social service worker, is the great factor in the "follow-up" work. The policy is to invite these workers, after they have proved themselves with some months of service, to become, on consent of their employing boards, members of this Bureau at a very nominal addition to their regular salary.

Active co-operation from other departments of the State Board of Health, particularly in laboratory work, has been valuable. Doctor Arms' plan for holding hook-worm clinics in the schools is splendid, and is making an impression on communities visited.

Respectfully submitted,

GRACE WHITFORD, M. D.,

Chief, Bureau of Education and Child Welfare.

REPORT OF ORTHOPEDIC DEPARTMENT,  
State Board of Health.

REPORT OF Dr. E. VAN HOOD.

Dr. W. H. COX,  
State Health Officer,  
Jacksonville, Florida.

My Dear Doctor:—

I herewith submit Annual Report of The Orthopedic Department of The State Board of Health, located at Ocala for the year ending December 31, 1918. It is better known as the Hospital for Crippled Children.

The medical profession of Ocala have shown a continued and gratifying willingness to assist in any way with the work and each is herewith tendered due appreciation. The citizens who have taken the children to ride, the dentists, druggists, barbers, story tellers, Christmas tree makers, and especially Mr. Ed. Carmichael, who gives the children freedom of Silver Springs as bathing and picnic grounds, and all who have in any way contributed of their time, patience, material or skill towards the welfare and comfort of the little ones, have placed us under many obligations.

We thank Professors Booie, Johnson and Blake for much and tedious labor in making the photographs. They do it gratis.

Dr. Harry Walters gives special rates for the X-ray work. Ocala Knitting Mills gives several dollars' worth of goods. Messrs. Geo. Pasteur Masters Company and O. K. T. Pot Company furnish Ambulance Service, and The Carnegie Library gives free use of its books. Each has our thanks.

Miss O. Dilday, Supt. Marion County Hospital, has cared for the children very acceptably. Generous Ed. Bennett gives free tickets to the "movies."

The Ocala Banner and Daily Ocala Star—especially the Star—have our appreciation for outspoken interest.

A word of recognition is due the social workers, field workers, teachers, nurses, etc., who are serving under Dr. Grace Whitford in The Child's Welfare and Education Department, recently organized by you, for their enthusiasm in cooperating with the Hospital for Crippled Children. They are responsible for seven children having an opportunity to get the benefit of the Fund and this new department promises much in the way of getting rid of the inertia that characterizes my patrons. This information is given you because it is not likely to be brought otherwise to your attention. Please furnish me with the name of each worker.

A local committee has been officially appointed to watch over the interests of the children committed here. This committee consists of Mr. Chas. Cullen, the local representative of The State Children's Home Society (Marcus Fagg, Supt.), Dr. Ed. Chace, Mayor of Ocala, and Miss Nellie Stevens, Supt. Ocala Primary School.

A special word about outdoor or correspondence cases. They are, as you know, quite numerous, and many live more than two hundred miles away, so it has happened that I have visited several at and in their homes, though you have not as a rule asked me to do this. Once you offered to pay me for this service "extra." The Child's Education and Welfare Bureau will, I hope, help me to solve this question as to transportation of the very poor whose income is so often less than their expenses.

I am pleased to know that you are much interested in this department, because you have so many times "dropped in" to take a look at the children and The Crippled Hospital, in the last twelve months. Your visits have "done good" every time and are therefore very much appreciated.

Very Respectfully,  
E. VAN HOOD.

## CASES SUCCESSFULLY TREATED.

Harvey Carey.—Bowlegs, double osteotomy, see photo and read history.

A. McGeehee.—Club foot and paralysis leg. Forceful correction and a brace for "loose" knee joint. See photo.

L. Godboldt.—See history and photos. His case is the "master-piece" of this year's work.

H. Link, col.—An ancient burn left his arm and shoulder helpless on account of the contractures. A "trick" operation was successful in dealing with the "batwing" that held his arm to the side.

E. Graham.—Clubfoot and knock-knee was successfully treated by operation, though the leg is shorter by nearly three inches. A steel extension will be given her. See photo. She paid all expenses—costing State nothing.

C. Weatherly.—Bassini for ing. obliq. hernia.

C. Weatherly.—Readmitted for hypospadias. Both operations were done and he is now practically normal. Hypospadias was operated by Bevan's method. See photo.

R. Peebles.—Removing Tonsils and Adenoids, and hookworms.

H. Cheshire.—Imperforate anus, which was operated some months ago but the boy was threatened with rectal stricture. It is being kept open.

M. Sparkman.—School girl with appendicitis. Her father paid the hospital fees and so the operation costs the State nothing.

W. Simmons.—Large adenoids and hookworms. He paid for assistant and as the work was done at office, the State is out nothing for this case.

E. Malpass.—School child, with uterine hemorrhage due to polyp hanging from interior of uterus. Polyp and its base removed but small bleeding persisted until uterine arteries were tied through vagina. Patient costs State nothing.

B. Hendry.—Hydrocele with congenital hernia. Operation made a cure.

H. Livingston.—Fracture of femur multiple associated with fragilitas Ossium. Patient has had three of these fractures. A good cast was applied and boy had had no fracture for 10 months. He is taking medical treatment also.

S. Ullman.—School girl. Cancer breast. Halstead operation. No return in 11 months. See photo. She paid all expenses—costing State nothing.

N. Baker.—Sandspur in larynx. Removed through a tracheotomy incision. He paid all fees for hospital and assistant. So costs the State nothing.

M. Hines.—Hipjoint abscess. A cast with fenestra to drain away the pus and thus keeping parts at rest and clean brought about a "cure" in ten months. Three casts were applied. She costs the State nothing but the plaster—being in the outdoor department. No deformity.

C. Maloney.—Kyphos and all the other symptoms of Pott's. A Bradford splint for a few weeks and then plaster jackets for a few months effected a cure, with no deformity.

H. Mizell.—Was a similar case plus multiple and extensive abscesses on back, hip, thigh and knees. Same treatment effected a cure. The hip is stiff. A later operation may relieve that.

C. Jordan.—Paralysis of soleus and gastrocnemius treated by Gallie's operation. Very much benefited. See photo. A more extensive operation may be done if desired at a later date.

No deaths. (Signed): E. VAN HOOD, M. D.

## DETAILED REPORT OF CASES TREATED.

## F. MATCHETT.

F. Matchett, aged 10 years, Citra. Paralysis leg.—In. Spi. Par. Family refused treatment.

## G. GOIN.

G. Goin, age 5 years, Ocala. Dr. Counts. Epilepsy traumatic. Kicked by horse some months ago, has had one operation for removal of crushed bone and parents object to further surgical work—am using medical treatment.

## P. DEAN.

P. Dean, col., age 20, Williston. Dr. Freeman. Arthritis of ankle. T. B. Refused surgical treatment. X-ray taken, costs State nothing.

## W. RANDALL.

W. Randall, age 12, Micanopy. Dr. Howell. Left inguinal hernia—congenital, Bassini operation. Cured.

## E. MALPASS.

E. Malpass, age 14, Hawthorne. Dr. Floyd. Uterine polyp. Excision of polyp with its base. Benefited greatly—but a second operation of tying the uterine arteries through the vagina was done. Patient having very little trouble. This patient is a school girl—bright and promising. State Health Officer gave special permission for this operation. Father paid all hospital expenses. Case costing State nothing.

## B. HENDRY.

B. Hendry, age 4 years, Coleman. Dr. Mitchel. Hydrocele with hernia. Incision, drainage and pressure. Cured.

## E. BAXLEY.

E. Baxley, 3 years, Hawthorne. Dr. Floyd. Hip abscess and Pott's disease. T. B. Von Pirquet's test positive. This case was reported last year. Patient remained in Hospital a few weeks, treated entirely on an open porch, by Buck's extension. Family physician had previously employed the same satisfactory method. Before cure was completed the mother insisted upon having the child at home—under protest—(purely a case of "over mother love"). Dr. Floyd is continuing the treatment under difficulties—child only holding her own—has fever and several abscesses. She should have either plaster jacket or a Bradford frame. We hope to have her soon in hospital again.

## H. STEWART.

H. Stewart, aged 8 years, Groveland. Dr. Register. Hip abscess. Osteomyelitis of ileum. The abscess is draining well. Ankylosis is established and the boy doing so well that he is now treated entirely in the "out door department" and so, costing the State nothing.

## J. SEYMOUR.

J. Seymour, age 12 years, Micanopy. Dr. Withers. Club foot, objects to treatment. Hope to get hold of him later.

## T. JAMES.

T. James, col., aged 3 years, Centralia. Dr. Coogler. Delayed gen. development, used thyroid ex.

**O. RICKETTS.**

O. Ricketts, age 2 years, Kissimmee. Dr. Winn. Delayed development mind and body. Treatment, thyroid ex., noticeable improvement.

**S. HUNTER.**

S. Hunter, age 10 years, Ocala. Dr. J. W. Hood. General lack of development physical. Treatment thyroid ex. Improvement slow.

**N. CARTER.**

N. Carter, age 5 years, Gainesville. Dr. Boring. Spastic paralysis—shoulder and arm—hook worm—adenoids—enlarged glands neck. T. B. Von Pirquet test positive. Patient remained in hospital for some time under treatment. Some improvement, however the paralyzed condition will require months if not years to correct. A letter plainly setting all this before the parents when the child was sent home was written.

**H. BECK, NOMA.**

H. Beck, Noma. Dr. Warren. Gun shot wound, ankle—Refused treatment.

**D. DENISON, HOBE SOUND.**

D. Denison, 10 years, Hobe Sound. Dr. Conkling. Paralysis of many parts of body, began when child was about 18 months old. Parents say it was preceded by diphtheria. Use of muscles in general is now fairly good with the exception of muscles of phonation and deglutition. Difficulty of talking sometimes not noticeable. Miss Bess Morehouse, Social Service worker of Palm Beach County, who brought the child, was instructed to use massage, general treatment and to report progress.

**W. WALLIS.**

W. Wallis, age 8 years. Dr. J. W. Hood. Adhesions clitoris and bed wetting. Chloroform given while adhesions were broken up. Cured.

**C. McNATT, TAMPA.**

C. McNatt, age 6 years, Tampa. Mr. Frecker. Spastic par. arm and shoulder, hook worm infection. Patient given course muscle training and sent home with definite instructions. Cases like this should remain in the Institution and suitable apparatus used upon them to give the limbs proper passive exercise. The hospital for Cripples lacks equipment and these patients cannot be satisfactorily treated until such apparatus is furnished.

**A. VICKERS, OXFORD.**

A. Vickers, age 12 years, Oxford. Dr. Wood. Myositis, ossificans of shoulder and muscles of back. X-ray, medical treatment.—Not improving. Case was reported to the State Med. Ass. 1918 in Tampa.

**M. DIXON, RED LEVEL.**

M. Dixon, age 18 years, Red Level. Dr. Irwin. Atax. spastica. Medical treatment. Patient may improve more or less but such cases are always unsatisfactory.

**S. DIXON, RED LEVEL.**

S. Dixon, age 16 years, Red Level. Dr. Irwin. Sister to M. Dixon. Same history of affliction from birth. Medical treatment.

**G. WICKER, MICANOPY.**

G. Wicker, age 16 years, Micanopy. Hodgkin's disease. Medical treatment—not improved.

**H. BAKER, OXFORD.**

H. Baker, age 8 years, Oxford. Dr. Slaughter. Sand spur in Larynx. Tracheotomy and removal. Cured. Cost State nothing. Parents paying hospital fees and assistant.

**E. TANNER, FRUITLAND PARK.**

E. Tanner, Colored, age 10 years, Fruitland Park. Dr. Morrison. Shot gun wound, hand, lost two fingers and thumb. Plastic operation. Cured. Cost State nothing.

**S. ULLMAN, SHADY.**

S. Ullman, Colored, age 14 years, Shady. School girl. Cancer breast. Halstead's operation. Cured. Cost the State nothing.

**M. HINES.**

M. Hines, age 5 years. Hip joint abscess. Applied three jackets plaster paris. Covering well the thigh leaving fenestra for access to the open wound in the hip. Patient made uninterrupted recovery. Now the picture of health.

**C. MALONY, KEY WEST.**

C. Malony, age 6 years, Key West. Dr. Warren. Pott's disease spine. Patient's photo appears in report of 1917. He has since made a perfect recovery.

**H. MIZELL, BARTOW.**

H. Mizell, age 6 years, Bartow. Pott's disease with extensive abscesses—hips and both thighs. Patient appears in report of 1917. For the past twelve months he has been well and growing rapidly. A remarkable case. He was treated in 1917 also.

**J. MOORE, MICANOPY.**

J. Moore, Colored, age 10 years, Micanopy. Epilepsy and spas. par. legs. Medical treatment. Improvement.

**R. BEARD, LADY LAKE.**

R. Beard, Colored, age 17 years, Lady Lake. Dr. W. H. Cox. Cerebro spinal meningitis. Medical treatment. Recovered.

**G. GRAVES, DUNNELLON.**

G. Graves, age 12 years, Dunnellon. Dr. Baskin. Chorea. Medical treatment. Recovery.

**I. GRAVES, DUNNELLON.**

I. Graves, age 14 years, Dunnellon. Dr. Griffith. Eye strain. Medical treatment. Recovery.

**E. MONTGOMERY, MICANOPY.**

E. Montgomery, age 10 years, Micanopy. Hemiplegia spastic from birth. Advice—improving.

**L. SELLARS, OCKLAWAHA.**

L. Sellars, age 2 years, Ocklawaha. Dr. Henry. Microcephalus. This is a tentative diagnosis. The child is being given thyroid extract.

**E. SMITH, MICANOPY.**

E. Smith, age 10 years, Micanopy. Short foot and leg, congenital otherwise normal, will be furnished with steel extension.

**I. TOWNSEND, GROVELAND.**

I. Townsend, age 15 years, Groveland. Dr. Register. Contracted tendons of knee. Short foot and leg. Advised manipulations, etc.

78 ANNUAL REPORT STATE BOARD OF HEALTH

R. PEEBLES, OAK.

R. Peebles, age 5 years, Oak. Dr. J. W. Hood. Tonsils and adenoids. Operation. Cured. Cost State nothing.

H. CHESHIRE, OCALA.

H. Cheshire, Ocala. Dr. Blitch. Imperforate Anus. Operation done some months ago, at birth but patient threatened with stricture of rectum. Now doing nicely.

J. TRULUCK, MORRISTON.

J. Truluck, age 18 years, Morriston. Dr. Willis. Mentally defective. Advised to see Dr. Randolph.

L. CLAYTON, OCALA.

L. Clayton, age 12 years, Ocala. Pharyngitis from fish bone in throat. Removed bone. Cured.

M. SPARKMAN, HAWTHORNE.

M. Sparkman, age 19 years, Hawthorne. Dr. Floyd. Appendicitis. Operation. Cured. This patient cost State nothing.

W. SIMMONS, KENDRICK.

W. Simmons, age 15 years, Kendrick. Dr. J. W. Hood. Adenoids and catarrh. Hook worms. Operation and medical treatment. Cured. Cost to the State nothing.

J. EDWARDS, OCALA.

J. Edwards, Colored, age 20 years, Ocala. Epilepsy traumatic. Shot in brain. Refused treatment.

A. KNIGHT, FORT PIERCE.

A. Knight, age 2 years, Ft. Pierce. Dr. Hardee. Delayed locomotion. Mus.-training "go cart"—and medical treatment. Improving.

H. LIVINGSTONE, KENDRICK.

H. Livingstone, age 12 years, Kendrick. Dr. Peek. Multiple frac. thigh. Fragilitas ossium. This patient has had three fractured femurs in three years. Casts and medical treatment. No frac. for twelve months.

HARVEY CAREY—Before Operation.

HARVEY CAREY—After Operation.

H. CAREY, age 7 years, Centralia. Double bow legs, hook worms, boils and adenoids. Treatment begun in 1917 by use of braces because parents objected to operation. Osteotomy at proper places on the tibiae. Plaster paris cast. Ad secundum artem has made a new boy. See photo. Medical treatment and operation for adenoids played important part in the transformation.

L. GODBOLDT. —1

L. GODBOLDT. —2

L. GODBOLDT. —3

L. GODBOLDT, age 7 years, Plant City. Dr.----- Total paralysis legs, hips and feet—I. S. P.—Has not walked in five and a half years, but crawled on "all fours," going backward instead of head foremost. When brought into the hospital he begged to not be MADE to walk and sat about in helplessness. The feet were talipes varus and the condition of legs and hips were non-descript—bending in any direction. See photo. As soon as the legs and feet were straightened by force and plaster casts bringing the foot fairly on the floor the boy was coaxed, rewarded and compelled in a way to walk 100 steps to meals three times a day aided by the nurse holding one hand. As soon as he grasped the fact that it was possible for him to walk he joyfully cooperated. The Hospital nurses and visiting physicians agree that this case is the year's masterpiece. He will never be a normal man, but he is taken permanently off the floor and manages his crutches with skill. He will use braces later and have legs massaged daily. See photos 1, 2, 3.

A. McGEEHEE—Before Operation.

A. McGEEHEE, age 9 years, Lowell. Dr. Van Engelkin. Talipes equino varus left. Total paralysis leg. In. Sp. Par. All deformities in patient corrected by operation. Is now wearing cast on knee only—so that it is unnecessary for her to use hand on thigh while walking with the "fai" leg. Will soon be given brace for knee. See photo.

A. McGEEHEE—After Operation.

JAMES CLAYBORN—Before Operation.

JAMES CLYBURN, age 2 years, Plant City. Dr.----- Talipes equino varus with internal rotation and bow legs. Treated by forcible correction and the E. L. Scott method with plaster cast. Little patient's legs are practically straight, but on account of "naughtiness" when accompanying photo was being snapped he refused to stand as he does at other times. The inversion may require an oteotomy later on. If a prognosis is allowed in these reports, it is safe to say, his legs will be well nigh perfect in a few months.

JAMES CLAYBORN—After Operation.

N. MILLER, Jacksonville,  
Age 6 years.  
Hemiplegia right from birth.

N. MILLER, age 6 years. Jacksonville, Dr. Gwinn. Hemiplegia right— from birth. This very bright boy illustrates well what muscle training can accomplish. At birth both arm and leg were equally paralysed, but being assisted upon his feet he walked after eighteen months of age, because he wanted to "get about." In this he was encouraged but the arm remained undeveloped for lack of use. See photo.

Speaking theoretically, if the arm had had the same conditions thrust upon it as the leg had in the beginning, it might now be a more useful arm.

A. EVANS,  
Refused treatment, Could be much improved.

A. EVANS, Colored, age 17 years, Brooksville. Dr. Creekmore. Total par. leg and partial par. foot. In. Spi. Par. Although assured that no operation was pending, the boy ran away from hospital. I had intended to put on a plaster paris cast to hold legs in straight position and in this way determine what could be accomplished by braces.

CLIO JORDAN—Before Operation.

C. JORDAN, age 10 years. Talipes, calcaneo-valgus right. Par. peronei and soleus.  
Inf. Spi. Par. Gallie's operation was done with much benefit.

CLIO JORDAN—Much Improved.

A. THIGPEN.

X-Ray Photo Before Removal of Bone.

X-Ray Photo One Year After Removal of Tibia. No Bone Has Reformd.

A. THIGPEN, age 17 years, Ocala. This patient has been in hospitals or under the care of specialists for twelve years. Began with osteomyelitis—T. B. One year ago I removed the tibia by sub-periosteal excision. Progress for the better has been slow. X-ray shows no bone returning. Have curetted three times for focal infection near head of tibia. Skin grafted extensively once. Intend transferring fibula to place of tibia as soon as conditions are favorable. Though local conditions are somewhat unfavorable, yet the boy's growth, vigor, health, and strength make me hesitate to amputate the limb, which I am advised to do by all doctors. See photo. Wrist and neck show scars following large bone abscesses four years ago.

**Before Operation.**  
Hypospadias, Probe pointing to opening in urethra  $1\frac{1}{2}$  in. from head of penis.

**After Operation.**  
Cured. Probe entering urethra at meatus in head of penis. The canal is straight and urination, etc., normal.

C. W., age 9 years, Ft. P. Dr. Van Landingham. Left oblique inguinal hernia. A Bassini operation was done. Result perfect.

The epidemic of "flu" came when he was recovering and though another operation was pending for hypospadias. State Health Officer advised no operations be done during the epidemic. The patient was readmitted for the hypospadias. Bevin's operation done. Result perfect. See photo.

**Cured**  
Hernia oblique inguinal (Bassini operation). Hypospadias (Bevan's plastic operation).

R. HEWITT.

X-Ray shows about eight inches of tibia removed with rubber tube placed to drain wound.

X-Ray January, 1919, about ten months after preceding X-Ray. Bone is reforming, except at lower part.

R. HEWETT, age 17 years, Citra. Dr. Creekmore. Osteomyelitis of tibia following typhoid (?). Patient was treated in Hospital in 1917 and is now in Out Door. His strength, health and growth are remarkable. X-ray shows gradual return of bony matter in the matrix of tibia.

MARIE ABSTEIN.

M. ABSTEIN, age 8 years, Fort Pierce. Dr. Booth. Xyphosis from Pott's disease. Corset. Disease arrested but may return, unless properly treated. See photo.

PAULINE CALLAHAN.

P. CALLAHAN, Melbourne. Left leg totally paralysed. Infantile Spinal Paralysis. Walks by throwing the left leg forward and holding the hand on the left thigh to prevent the thigh flexing under her weight. She needs a knee brace. See photo.

LOUISE SHELTON—Before Operation.

LOUISE SHELTON, age 7 years. Dr. -----  
from I. S. Paral. Tenoplasty peroneus longus. Casts. Benefited. See photo.

LOUISE SHELTON—Cured.  
Will need heel of shoe adjusted.

Tal. varus with cavus right,  
Benefited. See photo.

**WILLIAM REVELL,**  
**Walks with hand on thigh, will need a brace.**  
 WM. REVELL, age 8 years. Dr.-----  
 Pes planus right, pes cavus left with total paralysis  
 left leg from I. S. Paral. Tenotomy ten. Achil. right  
 and cast. Will apply knee brace to knee, using lock-  
 joint, when child is brought back. Patient is much  
 benefited.

**J. O. EDDY—Green Cove Springs.**  
 J. O. EDDY, age 10 months, Green Cove Springs.  
 Dr.----- Talipes varus. Double manipulation  
 and temporary cast. Preparing to treat case by Dr.  
 E. L. Scott's method. Parents cannot pay for trans-  
 portation back and forth to Crippled Hospital.

X-Ray Six Weeks After Removal of Tibia for Osteomyelitis.

X-Ray Eight Months After Removal of Tibia.

Using crutches and told to put no weight on foot. Doing nicely after an accidental fracture of the new tibia. See X-Ray.

A. CONNER, age 5 years, Dr. Johnson, Palatka. Osteomyelitis tibia. Had had curetting and other conservative treatment but the case relapsed. Was brought to Ocala by Mrs. Boyce, Charity Worker of Palatka, who asked to see the operation of sub-periosteal excision of the tibia which was found necessary after a free incision. Operation bloodless and otherwise very satisfactory as to progress of healing, etc. At end of six weeks an X-Ray was made (see X-Ray). Bony matter was seen reforming the entire length of tibia, and a cast was applied and boy sent home to await "developments." After much difficulty the boy was got back and looked over thoroughly. A fresh cast applied and instructed to put no weight on it—the instructions being given in writing. Boy was given crutches and sent home. After much trouble and a delay of four months I succeeded in getting the child brought to me again. I find he had broken the delicate tibia in a fall, though the tibia had grown to be larger than the fibula, and after taking an X-Ray (see X-Ray No. 2) to confirm these statements I applied a cast and sent him home again.

**EVA GRAHAM (Colored).—Before Treatment.**

E. GRAHAM, Colored, age 8 years, Jacksonville. Dr. Gwynn. Talipes equino varus. Genu valgus—with 22 deg. flexion of knee from unknown injury in childhood—near knee joint. Treatment tenotomy—forceful correction. Will fit steel extension of two and a half inches to shoe to give proper length to leg which has not grown in proportion to other leg. See photo,

**EVA GRAHAM—Cured.**

NORA ALDERMAN—Before Treatment.

NORA ALDERMAN, age 12 years, Fort Lauderdale, Prof. Brazel and Dr. Bird. Tal. equino varus left tal. valg. right with extensive involvement of left thigh and hip muscles. The sole of left foot did not touch the floor at any point. The inner edge only of right foot touched the floor when she walked, as proved by her shoe wearing away and exposing the "up-ber" very soon after getting a new pair. In walking a foot and leg were "slung" forward and then she placed a hand on her thigh to keep the knee from flexing as the body advanced. An astragalectomy on one foot and a tenoplasty on the other brought both feet squarely on the floor when she stood on them so that she was in a position to take "muscle training," and when she left the hospital at the end of seven months she was very much better and no doubt will continue if she keeps up the "training." See photo.

NORA ALDERMAN—Much Benefited After Treatment.

**H. LIVINGSTON.**

This is an interesting X-Ray without the boy's photo.

H. LIVINGSTON, age 12 years, Kendrick. Dr. Peck. Multiple frac. thigh. Fragilitas ossium. This patient has had three fractured femurs in three years. Casts and medical treatment. No frac. for twelve months.

**HOWELL LINK.**

H. LINK, age 8 years, Colored, Leesburg. Dr. Brady. Was burned some months ago on shoulder, right body and whole of arm. The parts healed leaving elbow flexed and arm confined to side by a web like wing of scar tissue in the arm pit, extending down five inches. A "trick operation" relieved the arm and skin grafts straightened the elbow, and a splint kept all in proper position. See photo—before operation.

## BUREAU OF VENEREAL DISEASES.

Report of H. O. Snow, M. D., Director Bureau of Venereal  
Diseases, Board of Health of Florida.

Tampa, Florida, February 8, 1919.

Dr. W. H. COX,  
State Health Officer,  
Jacksonville, Florida.

I have had charge of this Bureau for the State Board of Health since September 1, 1918, except for the time of the Influenza epidemic which covered the month of October and the first fifteen days of November, during which time all activities in this work necessarily ceased and I was occupied in Influenza work in Pensacola, Tampa, Fort Dade, etc.

I have taken, or had taken, about five hundred specimens of blood from prisoners in jails and prison camps over the State for the purpose of having those who showed evidence of having Syphilis treated, and for the purpose also, of establishing statistics whereby the prevalence of this disease might be in a measure determined.

There have been about three hundred specimens taken from prisoners at the State Prison Farm at Raiford, about sixty per cent of which give a 2 to 4 plus positive Wasserman reaction and these, who give any history of infection or any evidence otherwise of the disease, are to be treated by the Camp Physician.

I have made talks to County Medical Societies, Ministerial Associations, Rotary Clubs, Luncheons and wherever the opportunity presented; have called on druggists and physicians in the various cities over the state and urged their cooperation in this great work, and have, as a rule, met with ready response from them all.

I have addressed Councils and City Commissioners and had conferences with the individual members of these bodies and while some of them seemed rather to want to be sure of their ground before committing themselves, I have, except in the case of one city, received the support of these bodies, both financially and otherwise.

Clinics have been established in Tampa, Arcadia, Miami and the preliminary work has been about completed for the establishment of one in Pensacola, Key West and Gainesville. Arrangements have been about completed to take over the Venereal Disease clinics, white and colored, which have been maintained in Jacksonville by the U. S. Public Health Service, and the Red Cross.

I have been able to get the physicians of the State to take up the matter of reporting venereal diseases, and am beginning to get some actual reporting of these diseases.

The Board only requires the reporting of venereal diseases by serial or case number, and when the most of the physicians find that this is the case, they are willing to report their cases, as the principal objection to reporting has been the fear of violating professional secrecy.

A supply of literature for distribution has been ordered and will be distributed in a manner to best serve the needs of the public and to reach the largest number of people. Education of the public is realized to be the key note of work of this kind and every effort will be made to, and is being made to, accomplish this end.

The Tampa clinic, which is the only one that has been in operation for a sufficient length of time to be able to judge the cost per patient, has been in operation since about September first, except for nearly three weeks in October, during the epidemic. There have been five hundred and thirty-six treatments administered, which includes about one hundred and forty doses of Arsphenamine, and the total cost to January 1st for this clinic has been \$560.00, including the cost of Arsphenamine, or 606, and other necessary drugs, or about \$1.04½ for each treatment.

Taking into consideration the fact that the initial cost of furnishing for this clinic is included, I consider this quite a good showing.

Respectfully submitted,

H. O. SNOW.

# REPORT OF BUREAU OF DIAGNOSTIC LABORATORIES.

Jacksonville, Fla., Jan. 1, 1919.

Dr. W. H. COX,  
State Health Officer,  
Jacksonville, Florida.

Dear Doctor:

I have the honor to submit the following report of the work of the Central Laboratory and the reports of the Directors of the Branch Laboratories of the State Board of Health for the year 1918.

On April 1st Dr. C. P. Fryer left the laboratory force to become Health Officer of Pitt County, North Carolina, and June 1st Dr. C. W. Hepperlen was secured to fill the vacancy.

The work of the laboratory was showing a fair gain over the previous year at the end of the first nine months, but when in October the epidemic of influenza broke out the examinations fell to less than half the number sent in any of the previous three months nor did the number of examinations return to normal by the end of the year. A part of this decrease may possibly be due to the fact that many of the physicians who had used the laboratory freely had entered the service, we trust that 1919 will show a great increase in the use of the laboratories.

The following tables will aid in the study of the work of the laboratory.

TABLE I.  
COMPARATIVE TABLE SHOWING NUMBER AND KIND OF EXAMINATIONS.

	1903	1904	1905	1906	1907	1908	1909	1910	1911	1912	1913	1914	1915	1916	1917	1918	Total

1) Since August, 1916, all examinations of pathological tissue have been made in the Miami Laboratory.

2) All water examinations are now made by the Bureau of Engineering.

TABLE II.—DIPHTHERIA.

Positive .....	142	9.2%
Negative .....	1393	90. %
Suspicious .....	13	.8%
	1548	

A glance at Table I will show that only about one half as many examinations for diphtheria were made as in the previous year which was the lowest since 1912.

During the year 1918 there were about eighty deaths from diphtheria (this report is written before the December reports are at hand) and if we accept the very conservative death rate of ten per cent this would mean there were some eight hundred cases in the state, and if each of these were released by two successive negative cultures it would mean a great increase in the number of specimens submitted and would be a great protection to the people of the state.

Cultures should be taken from all in contact with a case of diphtheria and no case should be released except by negative cultures and these should be from both nose and throat.

TABLE III.—TUBERCULOSIS.

Positive .....	364	20.0%
Negative .....	1440	80.0%
Unsatisfactory .....	3	
	1807	

During the first eleven months of 1918 there were nine hundred and fourteen deaths from tuberculosis of the lungs and the best authorities tell us that for every death from this disease there are from seven to ten cases. If we take the smaller number this would mean that during this time there were at least six thousand three hundred and ninety-eight cases in the state, and if we consider that half the population is tributary to this laboratory it certainly shows that we should have many times the sputa sent for examination that have been in the past.

If we may judge by past epidemics of influenza we may expect many of those recovering from an attack the past few months to develop a cough which should be considered suspicious and a sputum examination may be of great assistance to these patients.

TABLE IV.—TYPHOID.

Positive .....	148	6.2%
Negative .....	2078	87.5%
Incomplete .....	150	6.2%
	2376	

In addition to the above thirty-three bloods were examined for paratyphoid infection one being positive the balance negative.

Many specimens are sent in during the first week of the disease and this accounts for a large percentage of the incomplete reactions.

During the first eleven months Florida lost two hundred and forty-two of its citizens from typhoid. A death rate of ten per cent of the cases is the standard index hence this indicates that there were over two thousand four hundred cases of the disease during this period. The laboratory could certainly have been of greater assistance than it was called on to be.

TABLE V.—MALARIA.

Positive .....	104	4.4%
Negative .....	2254	94.7%
Unsatisfactory .....	22	.9%
	2380	

Of the positives seventy were of the tertian variety, twenty-two aestivo-autumnal and twelve unclassified.

It would aid greatly if more care was taken when smears are made for they are all too often sent in such condition that a satisfactory examination is impossible. Smears should always be dried in the air and placed back to back for shipping. Directions for taking smears can be found on the back of each of the malaria data blanks.

TABLE VI.—INTESTINAL PARASITES.

Positive hookworm .....	519	25.0%
Positive other parasites .....	48	2.3%
Negative .....	1505	72.4%
Unfit for examination .....	5	

2077

Evidently the economic importance of soil pollution is not appreciated but it certainly is the greatest health question in the state. Campaigns to eradicate hookworm infection are without avail unless installation of sanitary privies is carried on at the same time, and this will not only prevent hookworm infection but it will cut down the incidence of typhoid as well.

The laboratory is prepared to assist any locality that desires to conduct a campaign to clean up.

In July we went to Cocoa and conducted examinations at the school building, there being one hundred and eighteen specimens submitted and of this number there were fifteen that showed hookworm ova and three other intestinal parasites.

During 1919 examinations will be made at many places as dates are already set for a number.

When these examinations are being conducted an educational campaign is also carried on, all forces working together and we feel that much permanent good is accomplished.

TABLE VIIa.—GONORRHEA.

Positive .....	287	33.0%
Negative .....	526	60.6%
Unsatisfactory .....	55	6.3%

868

TABLE VIIb.—COMPLEMENT FIXATION FOR GONORRHEA.

Positive .....	13	26.0%
Negative .....	34	68.0%
Suspicious .....	3	6.0%

50

There has been a decrease in the examination for this disease both by the smear and blood the past year.

TABLE VIII.—SYPHILIS.

Positive .....	1623	27.7%
Negative .....	2520	43.0%
Suspicious .....	852	14.5%
Anti-complementary .....	604	10.3%
Unsatisfactory .....	267	4.5%

5866

In 1917 these examinations had increased nearly fifty per cent over 1916 there has been a similar gain.

A great factor in the suspicious cases is the fact that a great many of the bloods were from treated cases.

A large number of the anti-complementary and unsatisfactory bloods were from a single institution and were bloods that had been kept for some time, in one instance over two months. This has been corrected and we are getting but few bloods that are not in good condition.

In spite of the fact that these have been routine examinations for the past three years we frequently have letters asking if we are prepared to make the tests

TABLE IX.—RABIES.

Positive .....	43	46.7%
Negative .....	41	44.5%
Unfit .....	8	8.7%

92

It is pleasing to be able to report a smaller number of these tests than during each of the two previous years but there were all too many cases of rabies in the state at that.

Of the positive heads thirty-eight were from dogs, one from a calf, two from cows and two from cats.

Respectfully submitted,

B. L. ARMS,

Chief Bacteriologist.

## BRANCH LABORATORY REPORTS.

Tampa, Fla., January 1st, 1919.

Dr. B. L. ARMS, Chief Bacteriologist,  
Jacksonville, Florida.

Dear Dr. Arms:

Herewith is submitted a complete tabulated report of the specimens examined in the Tampa Laboratory during the year 1918.

There was quite a material decrease in the total number of specimens examined this year over that of 1917, due primarily to the fact that a large number of the Tampa physicians entered the Medical Reserve Corps, and as yet have not returned to their pre-war practices. Another important item was the fact that paratyphoid A and B tests were made routine on all Widal specimens submitted during the early months of 1917; hence a total difference of four hundred and fifty-eight (458) examinations. During the recent influenza epidemic the Laboratory work was curtailed to a great extent because the physicians did not have time to take many specimens.

A very decided increase in the percentage of positives found is noticeable in the malarial examinations. The largest number of positive malarial specimens found was twenty-four in November, just following the influenza epidemic. We have also noticed a slight increase in the number of sputum specimens received for examination since the epidemic. The percentage of positive Widal's compared with that of last year shows a very substantial decrease. The total number of Wasserman tests made is gradually increasing, due in part to the activities of the Bureau of Venereal Diseases in establishing clinics for diagnosis and treatment.

We wish to thank those who have assisted and co-operated with us during the past year.

Respectfully submitted,

H. D. VENTERS, Bacteriologist.

Pensacola, Fla., January 4th, 1919.

Dr. B. L. ARMS,

Jacksonville, Florida.

Chief Bacteriologist,

Dear Dr. Arms:

The enclosed table gives a summary of the work accomplished in the Pensacola Laboratory during the year 1918.

There has been a falling off of the number of specimens received. This is noticeable in practically all kinds of specimens and can probably be accounted for by the absence of half the physicians of the community in the service of their country, and the consequent overworked state of those who have remained behind.

There is need for much more laboratory and public health work in this community. One can scarcely go down the street without seeing children, mostly from adjacent country districts, who are obviously hookworm sufferers. Typhoid fever has been far too prevalent, particularly in this city, and it evidences the URGENT need of an effective means of sewage disposal in sections where there is no sewer main, and the connection of ALL houses where there is one. (The U. S. Public Health Service is working now to bring about these changes, and if they succeed then constant vigilance must be kept to have the better conditions maintained.)

Diphtheria has not prevailed in West Florida to any extent during the year, and never has been very bad since the laboratory was established here and two negative—release—cultures have been required from each case. A few of the city school rooms have been examined culturally for the detection of carriers, but none was found.

The diagnosis of cerebro-spinal meningitis by examination of spinal fluid has been made several times during

the year, and that is an innovation in this laboratory, as also is the taking of throat cultures for release of convalescents from quarantine. An effort has been made to take such release cultures from all patients, but since the specimens must be taken at the bedside, planted at once on a special media and taken at once to the laboratory, there has been difficulty in maintaining the rule in all cases.

Much credit is due to the clerical assistant who has taken the place of office boy, made out practically all reports and assisted materially in preparing media, staining specimens and in the actual examination of them in many instances.

This report would be incomplete without a word of appreciation for the liberal attitude and hearty cooperation of the chief bacteriologist, the State Health Officer, and the members of the State Board of Health.

Sincerely yours,

F. A. BRINK,  
Bacteriologist.

**Laboratory of the State Board of Health, Miami, Florida,  
Report of the Year 1918.**

Dr. B. L. ARMS,  
Chief Bacteriologist,  
Jacksonville, Florida.

Dear Doctor Arms:

I have the honor to submit the following report of the examinations performed at the Miami Laboratory for the year ending December 31st, 1918. During this period, 2565 examinations were made, 213 examinations, not including pathological tissue work, gave positive results. A classified list of the positive examinations, showing the distribution by months, both for the specimens from Miami proper, and from the district served by the Laboratory, together with, a report of the Pathological tissue examinations is enclosed.

A study of this list shows, that a far larger proportion of the positive cases have occurred during the late fall, winter, and spring months, than during the summer months. This finding corresponds to similar ones of previous years, for this locality, and is accounted for by the well recognized greater seasonal preponderance of diseases during these months, and also to the fact, that the Florida East Coast, due to the tourist element, shows a great transient increase in population during the fall, winter, and spring, with, of course, a corresponding increase in disease conditions at this time.

With the exception of the Influenza pandemic, which affected this portion of the State during the latter part of the year, there have been only occasional isolated cases of disease, which have never attained epidemic proportions. In fact, we have been singularly free from disease.

The exact data which positive laboratory reports afford, is doing, more, and more, each year to clear up the

apprehensions of large numbers of our prospective Northern guests, who in the past, because of misinformation, have learned to look upon Florida as a pest land of Malaria and Typhoid. It is, indeed, of wonderful beneficial importance for Florida to be able to state that, of a number of suspected cases of Malaria and Typhoid, we have had but nine positive cases of Malaria, and but eleven positive cases of Typhoid, in a section of the Florida East Coast more than three hundred miles in extent, and embracing some of the most thickly populated sections of the State.

During the past year, the laboratory has been able to furnish the City of Miami with first-hand reports of communicable diseases, occurring within its confines, and by so doing, has been of considerable value in carrying on local intensive campaigns for the control, and in so far as possible, the eradication of disease; in particular, venereal diseases and tuberculosis.

Many examinations of a public health nature, have been performed for the three Government stations, located in this vicinity. Harmonious cooperation has been the rule in the relation of the laboratory with the public it serves; with the City Board of Health; and with the representatives of the Federal Government.

I would respectfully recommend for the ensuing year, that the State Board of Health build and maintain its own laboratory at Miami, as it is now doing in the other large cities of the State; that the laboratory be supplied with the adequate modern equipment for carrying on its work; that the present system of supplying Biological products to the public, free of charge, be continued, using the laboratory as a base for such supplies. I would further recommend that the salary of the assistant in this office, be made commensurate with the dignity of the position and the amount, and importance of the work performed. I am

Very sincerely yours,

HAROLD H. FOX, M. D.

## BUREAU OF ENGINEERING.

February 19th, 1919.

Dr. W. H. COX,  
State Health Officer,  
Jacksonville, Florida.

Dear Doctor Cox:

I consider it an honor to submit herewith attached for your earnest consideration my Annual Report of the activities and accomplishments of the Bureau of Engineering for the year ending December 31, 1918.

The year 1918 was a war year and in consequence all work executed in this particular department was so planned as to best meet the national emergency. The work done was varied in character, however, I believe we have reason to feel that whatever measures were attempted and fostered by the Bureau for health betterment were effective.

Owing to the varied nature of the activities indulged in I have deemed it best to divide the attached report into several parts, each treating of its own special features.

Before proceeding I desire to pay deserving respects to those who have so greatly assisted me in the conduct of the work during the year.

To my secretary Miss Lena W. Starck I want to extend the heartiest thanks for her loyal devotion and keen interest in the execution of all work she has done, which has been of the highest type. Her assistance is deserving of the greatest appreciation.

To Sanitary Patrolman John A. Lynch belongs great credit. He has been a worthy employee of the Bureau and one who has ever been conscious of the health betterment work undertaken. His admirable work during the year will ever stand out as commendable.

For the execution of many orders and the faithful promulgation of needed rural sanitation work I must com-

mend and thank the District Health Officers of the Board who have unhesitatingly assisted the Bureau.

I also want to express my appreciation of the great assistance rendered by P. A. Surgeon O. H. Cox of the United States Public Health Service and his corps of assistants who were ever ready to assist in any of the measures undertaken.

To the Honorable members of the Board I tender my sincere thanks for the degree of confidence and faith they have placed in the Bureau at all times. Never have they faltered when confronted by an emergency measure offered by the Bureau for their consideration.

To you, Honorable State Health Officer, I extend my thanks and appreciation for your hearty support of the Bureau's work during the year.

It is with great pleasure that I submit this report to you.

Respectfully submitted,

GEORGE W. SIMONS,  
Chief Sanitary Engineer.

### INTRODUCTION.

During the year 1918 the Bureau of Engineering was placed strictly on a war basis, only such work being undertaken and promulgated that tended to further our national interests in the great strife. All construction and extension of municipal utilities such as water supply improvements, sewerage plans or extensions and sewage treatment plants were discontinued soon after the declaration of war. The scarcity of labor, the high costs of materials and finally the government restriction placed on the use of certain materials of construction brought about a cessation of work which could be deferred until peace times. Few new projects along sanitary engineering lines were in progress; some cities were completing construction com-

menced previous to the war, others were planning for the period immediately following the war. In one instance a large sewerage extension plan was allowed by the government following an investigation by the State Board of Health and an assurance that the improvement could be considered as a health measure. One other city executed considerable sewerage extension during the year but all materials were at hand, plans had been made and money was available before the war. Consequently the activities of the Bureau of Engineering were slightly diverted from the usual path and readjusted to best meet the problems arising in the new emergency confronting the nation and attention was devoted to numerous details or plans of work belonging to or closely allied with the science of sanitary engineering.

Every effort expended was a distinct part of some plan to better health conditions among the whole civil population, particular attention being devoted to areas surrounding government reservations and shipyards. Florida, home of many government reservations, in reality became a large extra-cantonment zone making it necessary to carry sanitation propaganda into the most remote rural communities. It was realized that disability from a preventable cause was a national blight and one to be minimized in the time of national crisis. Therefore the efforts of this Bureau were concentrated and directed along those lines that would most effectively combat useless, careless and preventable disability. Every case of hookworm infection prevented, every case of typhoid fever prevented meant more hard workers and fighters of activity on this side.

During the early months of the year only sanitation work immediately surrounding government camps claimed the attention of the Bureau, studies being made to better cope with the new order of things. As the year progressed unforeseen problems were constantly arising for solution, brought about by the changed conditions and demanding the promulgation of new measures and regulations. In

this manner the field of activities was greatly enlarged in order to better meet the war work being conducted in the various communities.

In addition to the extensive emergency work conducted during the year a considerable amount of routine work was accomplished; several municipal sanitary surveys and detailed investigations of water supplies were made, swimming pool investigations completed, water bottling plants inspected and much miscellaneous work. In the following paragraphs a summary is made of the various activities classified under their respective heading.

### SANITARY INVESTIGATIONS.

The primary function of the Bureau of Engineering is to advise cities, towns and individuals of Florida in matters pertaining to water supplies, water treatment, sewerage, sewage disposal, refuse collection and treatment. During 1918 the number of detailed municipal investigations conducted were slightly curtailed owing to the significance of extra-cantonment and war emergency sanitation, also because of the inability of cities and towns to execute any extensive measures in view of materials and labor. Work was, however, conducted in the following places:

ARCADIA:—The specific work at Arcadia will be detailed more at length in the portion of this report treating of Extra-Cantonment Sanitation.

BRADENTOWN:—During the latter part of 1917 the attention of the Bureau was attracted to the quality of municipal water used by the City of Bradentown. The excessive hardness combined with objectionable hydrogen sulphide gas placed the water on the unfavorable list. Analyses were conducted in the laboratory and later the city council advised on what course to pursue. A new supply from shallow wells was advised against. The work on a new well and additions to the reservoir were under way during the closing days of 1918, and early in 1919 this city should be using a more satisfactory water.

BAY HEAD:—The Bay Head Orchard Company have acquired several thousand acres of land in Bay County to be laid out in pecan orchards. Settlers are being attracted to this section and sanitation is one of the first matters being considered by the promoters. A model town is being laid out, plans being considered for both water and sewage. The Bureau has been consulted as to the most feasible plans to follow in installing the proposed sanitary measures.

CHIPLEY:—During 1917 this city completed plans for a municipal sewerage system with subsequent disposal of sewage, however, the war interfered with plans. During the latter days of 1918, following the armistice, the former proposals were again being revived. In addition to the foregoing work anti-malarial oiling and drainage are being considered to rid the community of mosquitoes. This work will be done during 1919 in accordance with recommendations made by the Bureau.

CARYVILLE:—A conference was held with Mr. Waits of the Henderson-Waits Lumber Company relative to the execution of anti-malarial measures in the vicinity of Caryville. Preliminary plans were discussed. During 1919 this work will be under early consideration.

CHATTAHOOCHEE:—The water supply of the Florida Hospital for the Insane was investigated by sanitary survey and in the laboratory. In company with Engineer Hammatt of the State Board of Public Institutions a survey was conducted of the territory in the vicinity of the hospital to ascertain the existence of sanitary conditions of potential danger. A report was rendered making definite recommendations for a new deep well water supply.

COCOA:—Proposed municipal sewerage and water supply were discussed with mayor.

COCOANUT GROVE:—Following detailed laboratory examinations over a period of time the water supply of this community was investigated.

DELRAY:—General sanitary conditions in this city were noted following a report and recommendations given in 1917.

DE LAND:—In company with Dr. A. W. Underwood an investigation was conducted of the methods of sewage disposal employed about the city, also recommendations offered relative to improvements in immediate vicinity of business district.

FERNANDINA:—Early in 1918 the report was circulated in the press that Fernandina was about to become the shipbuilding center of Florida, consequently this led to a minute sanitary survey to ascertain the measures necessary. Later Dr. W. H. Bryan conducted a detailed survey, house to house, results of which are shown under Rural Sanitation.

GREEN COVE SPRINGS:—The proximity of this town to Jacksonville and because it was greatly frequented by soldiers from Camp

Johnston the council was advised to execute such orders as would place the town in a proper sanitary condition.

HASTINGS:—Proposed sewerage was investigated here, and such measures advised to remedy existing conditions. City later advised to prepare for municipal sewerage.

KISSIMMEE:—General sanitary matters considered with council, with Dr. A. C. Hamblin.

JASPER:—With Dr. W. H. Bryan a sanitary survey instituted here.

LAKELAND:—The sewage disposal problem confronting this city was discussed with the city officials. Later in company with the city engineer the plant visited, inspected as well as troublesome outlets. Later city requested to prepare some definite plan for early execution.

LIVE OAK:—City water supply inspected and council requested to rectify certain existing conditions conducive to bad health. Council further advised to take cognizance of recommendations made during 1916 relative to additional sewage treatment.

MIAMI:—Water supply at Dinner Key Naval Air School under investigation.

MILLVILLE:—Rural sanitation work in this locality investigated with Dr. Tatom.

MARIANNA:—City officials consulted and later definitely advised to enforce such measures as would remedy conditions about the city. Later Dr. Galphin made a sanitary survey here.

NOCATEE:—Sanitary work done here in connection with Arcadia cantonment work.

ORLANDO:—Water purification plant inspected on two occasions.

PENSACOLA:—This city was visited in company with Dr. Tatom, particularly to investigate an outbreak of typhoid fever attributed to dairies. In connection with this investigation dairies were visited, and general sanitary conditions as found laid before the city commission requested assistance in regards to the newly adopted privy ordinance. The commission was at this time addressed and advised to assure the State Board of Health that a timely collection service with rigid inspection would be a part of the new privy system. This was complied with.

PALATKA:—This city is served by two water companies, one a soft surface supply, the other a deep well supply subsequently chemically softened previous to use. The latter is owned and operated by the city, the former privately owned. During February 1918 a detailed investigation was conducted into both supplies, laboratory examinations made and report of findings with recommendations submitted to the council. The surface supply needed some significant improvements which were partially met—however, to date they have

not complied fully. The municipal supply was found to contain an excess of lime which made it quite unpopular with the citizens in general. Certain recommendations were made to the council but to date, as far as can be ascertained, nothing has been done to comply. A second investigation will be conducted during 1919.

PALMETTO:—The water supply of this place was investigated.

PHOSPHATE:—In the process of hydraulic phosphate mining great quantities of water are used. Following use this water is ponded and re-used as much as possible, although some waste occurs. The waters are settled in large settling basins which succeeds in removing quite a portion of the sediment held in suspension. The waste water from this particular mine finds its way to the Hillsborough River, consequently the question arose as to its effect upon the water of the river. Later this investigation will be made more thorough, especially since it may be necessary to resort to the River for later water supplies.

PANAMA CITY:—General Sanitary conditions were here inspected and recommendations made to the council.

PLANT CITY:—This city was considering the extensions to existing sewerage districts. Owing to war conditions materials were unavailable, and the work postponed until Peace times. The plans are going forward however.

PABLO BEACH:—The sanitary sewerage of this city was investigated with representatives of the U. S. P. H. Service. Also general sanitation measures in connection with extra-cantonment sanitation. Such ordinances were compiled as would handle the problems to arise.

ST. PETERSBURG:—Sewage disposal problems were under consideration here during the entire year.

ST. AUGUSTINE:—During the middle of the year this city inaugurated a new system of privies with collection service and disposal plant. It was thoroughly investigated and a detailed report of the findings with recommendations made to the city officials.

TARPON SPRINGS:—During the spring of the year this city desired to do some sewerage work. An inspection was conducted with the city officials, a report rendered and later the council addressed on what lines of work to pursue with money and materials available. This work was done during the closing months of 1918. General sanitary conditions were also greatly improved in this city.

WINTER GARDEN:—The city council of this place was addressed and advised to do certain work which was followed later. The city is also contemplating the installation of a new water supply system upon which the Bureau is lending advice.

## EXTRA CANTONMENT SANITATION.

Extra cantonment work was largely concentrated in zones surrounding Arcadia in DeSoto County and Jacksonville in Duval County where respectively two aviation training schools and one quartermaster training camp were established. Numerous analyses of water, for controlling the qualities of supplies used by service men, were also made of samples frequently submitted from the Naval Air Station located at Dinner Key near Miami, the Naval Air School located at Key West and the Marine Flying Field at Miami. The first detailed extra cantonment measures were applied at Arcadia, followed closely by those in the vicinity of Camp Johnston near Jacksonville. The Arcadia work was done in conjunction with District Health Officer, Dr. A. C. Hamblin, who following the preliminary work, kept the community constantly alive and alert to measures for health betterment.

As soon as it was definitely announced that the government would establish two aviation training camps near Arcadia the State Board of Health, in cooperation with the several city councils within the defined civil zone, took immediate steps to assume charge of the sanitation and control of communicable diseases within the specified zone surrounding the government reservations. Early in January, before much construction work had been completed Dr. Hamblin and the writer were on the ground to conduct intensive sanitary investigations to definitely ascertain the essential work to be done and the nature of measures to be instituted to cope with any situation which might arise and have an effect upon the cantonments.

The preliminary work done at Arcadia early in January 1918 consisted of the following investigations:

1. House to house canvas to note:
  - (a) General and ordinary sanitary environment.
  - (b) Presence or absence of window and door screens.
  - (c) Presence of manure accumulations and how kept.

- (d) Whether house was available to city sewerage and whether or not it was connected.
  - (e) Presence and conditions of privies in unsewered areas, also proximity of such areas to sewerage.
  - (f) Whether house was supplied with city water and if not, the supply used.
  - (g) Source and physical conditions of private water supply.
2. Investigation and condemnation of open privies and immediate notification of such action through newspapers.
  3. Investigation of all restaurants, lunch rooms and eating houses to note conditions and placing the proprietor of same on record for appearance in court upon non-compliance with orders.
  4. Investigations of dairies.
  5. Investigation of meat markets and grocery establishments.
  6. Investigation of municipal refuse collection and disposal.
  7. Investigation of drug stores and other places where soft drinks are sold.
  8. Thorough review of all existing ordinances as affecting public health and recommendations for new ones.

The above investigations crystallized the need of improvement brought to light the existence of numerous insanitary conditions in need of immediate attention, also the need for further city ordinances and municipal supervision to better and more ably handle the arising problems.

The house to house survey revealed certain conditions necessitating remedies, such as the use of insanitary privies within sewerage areas, the presence of and use of poor shallow well water supplies within access of safe municipal water supply, the improper care of manure at some stables, and the need for the better screening of homes. The survey of the unsewered negro quarters further disclosed the existence of at least 500 open, foul privies. Following are shown the results of the survey of 286 homes, exclusive of the colored quarters:

## 1. SEWAGE DISPOSAL:

House connected with city sewerage.....	184
Houses in sewer area, yet maintaining open privies....	92
Cess pools .....	2

## 2. WATER SUPPLY:

Houses having city water connections.....	205
Houses using shallow wells (poor).....	74
Private deep well supplies .....	3
Metallic rain water cistern supplies.....	7

## 3. SCREENING OF HOUSES:

No windows or doors screened.....	62
Partially screened.....	10
Houses well screened.....	210

## 4. CARE OF MANURE:

Barns cleaned regularly and manure removed.....	10
Barns cleaned and manure removed for fertilizer.....	22
Barns having manure thrown carelessly around yard.....	8
Barns having no manure around.....	235
Barns leaving manure at barn.....	5
Manure put into covered boxes.....	1
Manure put into open box.....	2

## 5. GARBAGE COLLECTIONS AND DISPOSAL:

Houses using city collection.....	217
Houses burning all waste.....	3
Houses burying all waste.....	3
Houses feeding to chickens.....	43
Houses thrown away promiscuously.....	18

The above results of the house survey imparted the following information and clearly specified the need for remedying conditions:

1. That there were within the sewerage district, which comprises 85 per cent of the incorporated area, a number of houses (98) accessible to but not connected with the sewer system. These houses were, for the most part, using the open privy as a means of sewage disposal in preference to the municipal sewerage system. The enforcement of the city ordinance relative to sewer connections could readily handle that situation and thus eliminate the open privies then used.

2. That a number of houses (74) were deriving their drinking water supplies from shallow driven wells, obtaining water in many instances of a potentially dangerous quality. Practically all these houses were accessible to water connections, but the occupants preferred the shallow

well supplies to the hard sulphur water furnished by the city.

3. That manure was not properly cared for and allowed to remain in exposed piles, germinating flies at a constantly favorable temperature.

In addition to the carelessly deposited manure accumulations in the resident district, there are several public stables and hitching lots in close proximity to eating places and stores, allowing manure accumulations to remain exposed and unprotected.

4. That no specified rules had been offered at any previous time relative to the retention of garbage and wastes at the households. Uncovered, leaking, wood pails and boxes were common everywhere, attracting privy flies directly to the kitchen.

5. That most of the houses were well screened against the admission of flies.

6. In the colored quarters, located compactly in the southwest portion of the city, the sanitary conditions were bad. The houses were wholly unscreened as a rule, the privies were wide open and filthy, the water supplies for the most part were derived from shallow wells. Furthermore, in this district were found a number of low ground depressions and ditches filled continuously with water, favorable to the breeding of mosquitoes, which should have been drained. In this district there were found approximately 500 filthy open privies.

An inspection of restaurants, lunch rooms and other eating places disclosed that there was sufficient room for improvements. Eleven restaurants were found in a comparatively insanitary condition. Pies, cakes and cooked foods were carelessly exposed to flies and dust contamination on counters in direct violation of the city ordinance regulating the screening of such food stuffs, and in most instances the kitchens were crowded, dark and unclean. Garbage was badly kept at each place and the protection

against flies was only fair. Restaurant and eating house operators were placed on immediate notice to clean up and thoroughly clean their establishments, also use precaution in the washing of dishes and eating utensils, and properly protect by screening all foods. After several follow-up inspections the eating house managements complied with the regulations satisfactorily.

The eleven grocery stores inspected, with one or two exceptions, were properly observing the state and city screening and food protection regulations. The meat shops presented modern, clean and sanitary places of business. The bakeries were in a fair condition requiring only a few recommendations for the bettering of their sanitation. The dairies supplying the communities were thoroughly inspected and subsequently the owners notified of certain improvements that were needed badly. To more effectively control this business it was deemed advisable to offer to the city officials an ordinance relative to the dairies.

At the conclusion of the sanitary survey a meeting of the City Council was convened for the purpose of discussing the data collected. The conditions as found were imparted to the assembled body of councilmen and the following recommendation was immediately acted upon:

1. That additional ordinances be passed to immediately
  - (a) Condemn all open privies and further require that all property owners shall at once proceed to remodel or reconstruct their privies in accordance with plans offered by the State Board of Health.
  - (b) To eliminate all possible places where water may collect, stagnate and act as mosquito breeders. This ordinance shall apply to old pails, cans, boxes, barrels as well as ditches, pools, etc.
  - (c) To abandon the use of the common towel and drinking cup.
  - (d) To regulate the production and bottling of all milk sold within the corporate limits of the city.
  - (e) To prescribe a regulation, standard size, metallic garbage can, and further specify a place where same may be found by the collector.
  - (f) To eliminate the careless depositing of manure accumulations and providing for the screening of stables, etc.

Other recommendations offered by the State Board of Health for the betterment of conditions were:

2. That all ordinances on the statute books at the present time must be immediately enforced, namely those relative to sewer connections and screening of foodstuffs.
3. That water lines be extended to outlying districts where sewer lines are now available so as to permit such properties to connect with sewers.
4. That a public convenience station be located near to the business portion of the city for the use of transients and others.
5. That a full time sanitary officer be appointed without delay whose duty it will be to constantly inspect and rigidly enforce all health ordinances now on the books and those to be passed. The sanitary inspector shall have full police powers.
6. That in the future there shall be an absolute prohibition of the sale of all foodstuffs in any manner or form from carts, wagons, stands or other temporary or improvised arrangements. All restaurants, lunch rooms and eating houses must be suitably housed, properly equipped with utensils to maintain sanitary conditions.

At the meeting of the city council referred to above, without any difficulty and at the earnest request of the State Board of Health, the city council passed the recommended ordinances, also assented to the appointment of a full time sanitary inspector to enforce all ordinances pertaining to the public health. The council further agreed to pass, at any time the State Board of Health deemed necessary, such other ordinances as are requested.

Subsequent to the sanitary survey, inspections and adoption by the council of all recommended ordinances and suggestions the actual work commenced. The city appointed a sanitary police who worked mainly under Dr. Hamblin's direction. The council furthermore arranged with a local contractor for the wholesale installation of Florida Tank Privies. Through newspaper articles, official notifications and public addresses the public was kept in constant touch with the movements under way.

At weekly intervals during the year District Health Officer Dr. A. C. Hamblin, returned to Arcadia to note progress with the previously outlined sanitary measures. It was particularly gratifying to note the excellent work executed in the conduct of privy construction in the unsewered colored quarters. Within a few months time nearly five hundred Florida Tank Privies had been constructed and put into operation in this district. The sanitary officer appointed by the council was active in securing the correction of many of the existing conditions as revealed by the first survey. Water mains were later laid to outlying portions of the city allowing residences to acquire safe water for use, also allowing for sewerage connections. A number of sewerage connections were also enforced within the sewered area. Through Dr. Hamblin's activity and upon his initiative numerous public meetings were held with the commercial club, women's club and council for the furtherance of sanitary measures. During the summer considerable drainage or anti-malarial work was accomplished by the city, work that effectively relieved the lowest portion of the city of much stagnant water. Considered on the whole the Arcadia work was very effective and Dr. Hamblin deserves much credit for the admirable manner in which he had all the recommended sanitary measures carried out.

The essential sanitation and health work to be accomplished in the large zone immediately surrounding Camp Joseph E. Johnston, near Jacksonville, included numerous details of diverse character—from the examination of water samples from some remote shallow dug wells to the sanitation of food vending around shipyards. Early in the year at the invitation of the State Board of Health the United States Public Health Service established an official station in Jacksonville to assist in the conduct of sanitation measures. The medical officer detailed to direct the activities of the station was Past Assistant Surgeon Ora H. Cox.

Following the arrival of Dr. Cox a preliminary survey was made of the whole zone and several conferences held to determine what portions of the entire program the State was best equipped to handle. The preliminary survey clearly indicated the necessity for intensive and extensive rural sanitation work in the vicinity of camp, particularly those areas just outside the city limits of Jacksonville. The Public Health Service agreed to proceed with the rural sanitation work, the building of privies in scattered sections nearest to camp and the State to conduct rural sanitation work in the thickly settled territories just beyond the city limits of Jacksonville. It was further stipulated that all analytical water work would be done by the State also any other sanitary measure outside the city limits not falling in the realms of rural sanitation. Later as the work progressed the State assumed further responsibilities, especially pertaining to the sanitation of areas adjacent to shipyards. The enforcement of sanitary rules and regulations in nearby cities and towns frequently visited by soldiers from camp, namely at Palatka, Green Cove Springs, Pablo Beach was also undertaken by the State.

The rural sanitation campaign was actively commenced during April when an intensive house to house sanitary survey was inaugurated in the Lackawanna section west of Jacksonville.

A record of the sanitary conditions existing at and around each house was made. The location and source of water supply was noted among other things, the mode of excreta disposal received an official notification requesting improvements within a specified time, usually fifteen days. When the survey and follow-up work had been concluded in this section it was extended to other regions until late in the fall practically all areas adjacent to Jacksonville had been completed. In addition to the sanitary survey and privy work "Clean Up" days were designated in the several communities, the Board of County Commissioners kindly loaning the necessary wagons and men for the process of cleaning. Clinics were established at stated times in the

several portions under attention with a District Health Officer in charge where hundreds of anti-typhoid inoculations were administered. Public sentiment for better health and sanitation was aroused by public mass meetings, addresses at women's and mother's club meetings, newspaper publicity and by the distribution of thousands of circulars and the posting of many placards.

The communities in which sanitation work was being conducted cooperated with the health authorities in every detail, everyone made efforts to speedily and expeditiously execute the recommendations requested, with the least possible delay. A civic conscientiousness was aroused and everyone labored under a realization that clean, sanitary environments were conducive to improved health conditions, as subsequently shown by the results.

The sanitary survey as conducted in areas outside the city limits of Jacksonville acquired significant data from 2188 homes housing nearly 8400 people. Twenty one hundred eighty-eight (2188) families were interviewed in the survey, of this number 1476 were white families and 712 were colored. This work was first conducted in the west Jacksonville area and later extended to other portions. The following briefly outlined data was collected:

## GENERAL:

Number of houses inspected.....	2188
Number of persons in homes.....	8391
Number of white families .....	1476
Number of colored families .....	712
Average number of people per house.....	4
Average number of rooms per house.....	4

## HEALTH RECORD:

Average number ill at time of survey.....	207
Number cases typhoid fever in last five years among those interviewed.....	101

## GENERAL CLEANLINESS:

Homes and surroundings in	
Good condition .....	392
Fair condition .....	1360
Bad condition .....	325

## SCREENING OF HOMES:

Completely screened .....	1109
No screening .....	1026

## SOURCE OF WATER SUPPLY:

Artesian or community supply.....	859
Open wells .....	16
Pumps, driven wells .....	998
No supply .....	315

## EXCRETA DISPOSAL:

Number of houses with insanitary privies.....	1687
Number of houses with sewer, septic tank, etc.....	484
Number of houses with no excreta disposal.....	17

The foregoing data shows in a simple manner the sanitary conditions existent at the time of the survey. It will be noted that the illness rate at the time of the survey was rather high being nearly 25.0 per thousand people. The typhoid history of the investigated areas was also excessive, however 70 per cent of these cases were reported from the west Jacksonville section (about 70 per cent). The results indicate that the general cleanliness of the surroundings was only fair. This heading refers to the presence of loose debris about the premises such as old paper, rags, tin cans, boxes, etc. Only about 50 per cent of the houses were screened against the free admission of flies and insects—and more than 77 per cent of the houses were equipped with insanitary privies.

This latter fact combined with the unscreened houses, semi-clean conditions and high intestinal infections incidence emphasizes the necessity for improvements.

At the time of the house survey each user or owner of an insanitary toilet was advised to install a sanitary privy within a reasonable time. In addition to the privy notification work "Clean Up" days were arranged and clinics established for administering anti-typhoid inoculations. Community gatherings were addressed by government and state health authorities and as a result of consistent efforts practically ninety-five per cent of the insanitary conditions as recorded in the foregoing table were eliminated.

During the summer months strict attention was devoted to every case of intestinal infections—typhoid cases were carefully noted and special stress applied to sanitation in those particular areas wherein cases occurred. Almost daily typhoid cases were reported from unworked sections—but these gradually dropped. And it is very gratifying to note that during the past three months from October to December (inclusive) only two cases of fever had been reported and from the west Jacksonville district not a single case has been recorded for more than four months.

The work was done by the people in a good spirit, everyone realizing that the country needed healthy individuals in time of stress.

In addition to conducting sanitation work in the outskirts of Jacksonville, the Bureau heartily cooperated at all times with medical officers on the staff of the Camp Surgeon, to remedy or eliminate nuisances of potentially dangerous character. In conjunction with medical officers and at the suggestion of Camp Surgeon, Lieut.-Colonel Joseph Y. Porter, a sanitary investigation was made of the camp's water supply. Samples of water were examined (discussed under water laboratory) from many points over a period of time and later the liquid chlorine apparatus of the State's was loaned to the camp authorities until such a time when its further use was not considered necessary. Working in cooperation with Chief Sanitary Inspector, Major John A. Vogelsson, several food and drink vending shops operating in vicinity of camp and frequented by soldiers were regulated to make them fit places for soldiers to visit. Also at the suggestion of Major Vogelsson all shallow dug wells within a seven mile radius of the reservation were examined and if found contaminated were ordered closed. Working harmoniously with these army officials was a source of much gratification and it served as an incentive to accomplish further things. To Colonel Porter and Major Vogelsson much credit is deserving for their con-

fidence in the functions and powers of the Bureau of Engineering and the State.

During the spring of 1918 water samples submitted from the Naval Air School near Miami seemed to indicate that contamination was existing. An inspection trip was made to this camp, a conference held with the constructing engineer and later certain recommendations made were complied with. Throughout the year the Marine Flying School at Miami submitted numerous samples of water for examination in order to keep a constant check on the water used by their men. Samples were also received several times from the Aerial Gunnery School located at Larkins, near Miami.

#### SHIPYARD ZONE SANITATION.

As previously stated the State Board of Health assumed charge of more sanitary work during the summer months, particularly that in areas surrounding shipyards as pertaining, especially, to the preparation and sale of foodstuffs. Employees of Dr. O. H. Cox, U. S. P. H. S., were constantly regulating and agitating sanitation measures within the several yards, administering thousands of anti-typhoid inoculations as well as keeping frequent checks on the quality of water used by the men. Frequent analyses were made by the Bureau of Engineering. Owing to the inadequate feeding facilities within the yards numerous venders of food seeing a chance for easy money immediately commenced food vending outside the yards. These venders observed absolutely no sanitary precautions in the clean preparation of or dispensing of foodstuffs. Following a thorough investigation it appeared that a special State Board of Health ruling should be drawn up to properly control such conditions. Consequently the State Board of Health in an assembled meeting on September 6th, 1918, passed Rule No. 72.

In accordance with this ruling the following set of regulations were prescribed subsequent to conferences with the Honorable State Health Officer, W. H. Cox, P. A. Surgeon, O. H. Cox, and Major Vogelsson of Camp Johnston. Copies of this ruling were then prepared and distributed to every food vender, five days being given to comply with the stipulations. The ruling automatically eliminated a number of the promiscuous dirty vendors that were a source of danger to the shipyard workers. Others provided excellent, well equipped screened dining rooms, while still others prepared foods and offered same for sale in approved sanitary individual packages.

#### A Rule Covering The Preparation And Sale Of Foods In The Vicinity Of Ship Yards, Government Reservations And Other Places Wherein War Work Is Being Carried On.

All foods offered for sale in areas surrounding shipyards, government reservations and other places wherein war work is being carried on:

- (1) Shall be prepared in tightly screened buildings, which shall be kept free from insects and vermin. All buildings shall have tight substantial floors and they shall be scrubbed daily and kept clean at all times.
- (2) All persons, firms or corporations engaged in the preparation, sale and vending of foods shall be provided with State Hotel Inspection, State, County and City Licenses and have same conspicuously displayed at all times.
- (3) All premises where foods are prepared:
  - (a) Shall have an abundant supply of portable water and there shall be an adequate supply of hot water. Surface wells shall not be used and any such wells on the premises shall be abandoned and filled with earth.
  - (b) Shall have a sanitary toilet or privy. If a privy is constructed it shall be at least 100 feet from the building.
- (4) All liquid wastes resulting from the preparation and serving of foods shall be disposed of in a fly proof soakage pit. Throwing of dishwater or other waste water on the ground is prohibited.
- (5) All persons or places preparing or selling foods shall be equipped with suitable, substantial refuse cans of an approved type, conveniently located wherein all refuse matters shall be deposited.

All garbage shall be buried daily with at least two feet covering or removed to an approved disposal place.

(6) All dishes, eating and drinking utensils shall be thoroughly cleaned with soap and boiling water immediately after each individual use. All containers, tables and like equipment shall be scoured daily and kept clean at all times.

(7) All persons engaged in the preparation, handling and selling of foods shall be free from communicable diseases and shall have a certificate of health either from the U. S. P. H. S. or the State Board of Health or other Medical Officer. Each person shall be inoculated against typhoid fever.

(8) All foods offered for sale shall be wrapt in clean oiled paper and sold as individual sanitary packages, i. e. box lunches, tightly covered tin pails, etc.

(9) All foods not sold in sanitary packages and not prepared where offered for sale shall be served only in approved, thoroughly screened substantial buildings.

The above rules are promulgated in pursuance of Rule No. 72 adopted by the State Board of Health, September 6th, 1918.

#### RURAL SANITATION.

Rural sanitation is one of the most difficult and one of the most significant problems confronting this State. It vitally affects many people when we consider that about 70 per cent of our state's population is rural. It is strictly a problem of education depending for its success and advancement upon the observance and practice of sanitary laws and rules by individuals. Our schools some times (more now than previously) include courses of hygiene and sanitation in their year's work, yet these same schools maintain filthy toilets and improper drinking fixtures contrary to the lessons they teach. One great rural sanitation expert has aptly stated:

"The need of advancement of rural sanitation is all too obvious even from casual observations. In the cruder matters of sanitation, such as the cleanly disposal of human excreta, the safeguarding of water supplies against contamination with filth, and the protection of foods from invasion by flies, most of our country

homes are lacking. As a result of the insanitary conditions in our rural districts thousands of our people every year are needlessly dying."

During the latter half of 1918 the State Board of Health inaugurated a preliminary rural sanitation survey to ascertain the existing conditions. Work was conducted in fifteen typical communities over the state, in addition to the three areas contingent to the city of Jacksonville. In making the survey the U. S. P. H. Service standard house survey card was used. The house to house work was largely done by the District Health Officers W. H. Bryan, G. A. Dame, L. T. Galphin and sanitary patrolmen. The preliminary results are shown in the following tables. At a later date when all work has been reported and all data finally compiled a detailed report on Rural Sanitation will be issued. Until then the following form will be presented.

TABLE I. EXTENT OF WORK.

Town	No. of homes surveyed.	No. of public lectures.	No. of anti-typhoid inoculations given

Average Score of all communities.....	6.7	16.0	2.7	5.8	9.0

The findings at the homes surveyed in the fifteen fairly representative rural communities impart a considerable quantity of definite valuable data of vital interest to every citizen in the state, who is interested in health welfare work. The foregoing figures are not estimates, they present definite findings. These figures show clearly that sanitary conditions in the rural communities need serious consideration and correction.

Of 6174 homes 4311, about 70 per cent, were equipped with very insanitary means of excreta disposal; 3227 or about 50 per cent of the homes were totally unscreened to prevent flies having free access to nearby deposits of human and other filth from entering the dining rooms and kitchens to contaminate foods to be eaten. 4786 homes, about 80 per cent kept animals, yet only five per cent protected in any manner the manure collections.

The figures just presented plainly indicate that rural sanitation and the promulgation of sanitary rules must be continued with renewed and determined vigor in every community. The people welcome the work gladly, especially when they note the subsequent decrease in sickness. Furthermore this work is significant to protect the young from blights of hookworm infection—the foundations of the structure must begin at the ground.

From August fifth to the end of the year District Health Officers submitted to the Bureau weekly reports of their soil pollution activities. These reports were compiled and sent forth weekly to the field men and Board Members. Following is shown the final report to December 31st, 1918. Only that work reported by District Officer on regulation form appears in table.

### ACCUMULATED RESULTS OF SOIL POLLUTION WORK.

Dating from August 5th, to December 31st, 1918.

	Hamblin	Dame	Bryan	Galphin	Tatom	Underwood	Keely*	Total
1. Towns visited -----	81	65	33	44	11	70	12	316
2. Ordinances passed -----	5	2	---	3	1	3	1	15
3. Anti-typhoid inoculations given -----	---	720	---	49	1500	67	98	2434
4. Public addresses given -----	26	32	5	4	2	28	4	101
5. Privy notifications served -----	63	625	14	433	190	277	687	2289
6. Privies actually built -----	692	782	---	8	363	850	396	3091
7. House survey cards completed -----	---	837	1630	525	---	1150	798	4940
8. Other condemnations -----	48	60	31	23	67	22	38	289
9. Samples submitted to laboratory -----	---	32	---	23	---	8	32	95

From the foregoing report it will be noted that the work done was quite extensive, indicating clearly that the people of the state welcome Soil Pollution Work.

\* Assumed duties as Field Officer September 6th, 1918.

**WATER AND SEWAGE LABORATORY.**

The water and sewage laboratory of the Bureau of Engineering has just completed its greatest and most significant year. The function of this laboratory is being more fully realized by the people of the state as shown by the accompanying list of cities which clearly indicates how far reaching the analytical work of the water laboratory is—touching as it does every section of the state from the most remote rural sections to the populated centers. During 1918 sixteen hundred fifty-seven (1657) samples of water were bacteriologically examined, representing an average of 4.5 samples per day. These analyses were distributed over the months as follows:

January	85
February	38
March	39
April	83
May	132
June	99
July	103
August	228
September	269
October	260
November	166
December	156

As stated elsewhere under the treatment of Extra-Cantonment Sanitation a considerable number of water examinations were made in connection with work of definite investigations. Nearly every government reservation in the state utilized the water laboratory facilities. During May, for instance, many samples (64) were collected from Camp Johnston and examined as part of the joint investigation of the water supply.

Annually in accordance with a Federal Act every railroad operating in the state must submit samples of all waters used for drinking purposes on trains engaged in in-

terstate traffic. During 1918 the number of these samples did not approach those made during the preceding year. Those made and their origin for 1918 were as follows:

One great achievement during 1918 was the passage by the State Board of Health of the following Rule No. 69 relative to bottled waters:

## A Rule Regulating The Manufacture, Importation And Bottling Of Waters.

SEC. 1. It shall be the duty of every manufacturer, importer, bottler or other person, firm or corporation, manufacturing, bottling or importing in the State of Florida, any artificial or natural mineral, spring or other water for drinking purposes, to file, on or before August 1st, 1918, and on or before each succeeding January 10th, under oath, with the State Board of Health the name of such water and the exact location from which it is obtained, together with the chemical analysis and the bacteriological examination thereof, and when manufactured the exact formula used in its production, giving qualitatively and quantitatively each and every item entering into its composition.

SEC. 2. No person, persons, firm or corporation shall manufacture or bottle mineral, carbonated, spring or natural waters in the State of Florida after August 1st, 1918, and after each succeeding January 1st, without a permit from the State Board of Health. No permit shall be required, however, where the city water supply is conducted through closed pipes and connected with a carbonated apparatus, from which it is dispensed directly to the consumer, without coming in contact with the air and not handled in any way. The State Board of Health however, reserves the right to revoke any permit or permits at any time when, after a thorough investigation, examination and public hearing, the domestic use of the water of any person, persons, firm or corporation shall appear to it to be a menace to the public health.

SEC. 3. It shall further be the duty of every manufacturer, bottler, importer or other person, firm or corporation manufacturing, bottling or importing in the State of Florida any artificial, natural mineral, spring or other water for drinking purposes to provide the State Board of Health with two bottled samples, as prepared for sale on the market, every two months for laboratory examination as to purity.

SEC. 4. Any person, persons, firm or corporation violating any of the provisions of the above sections shall be deemed guilty of a misdemeanor and upon conviction thereof forfeit his or its permit or pay a penalty not to exceed two hundred dollars or both at the discretion of the court.

Adopted by the State Board of Health at a Special Meeting at Tallahassee, Florida, April 18th, 1918.

The annual use of bottled waters in Florida is great, especially during the winter or tourist season. Practically all municipal water supplies in Florida are derived from

deep underground sources, generally the Vicksburgian limestone areas. Considered from a sanitary standpoint the supplies possess excellent qualities free from excessive bacterial counts and contamination of a potentially dangerous character. However, a great many underground supplies have inherent some chemical objections to the initial users. An excessive hydrogen sulphide content is disagreeable to taste and smell, an excessive hardness according to some diagnoses is detrimental, while in some cases a slight degree of salinity or saltiness is present. These latter chemical objections have caused the bottled water industry to gain ground, oftentimes by magnifying and exaggerating the serious (?) defects of the local municipal supplies from a health standpoint.

The sale and consumption of bottled waters is almost wholly dependent upon the belief in the purity and wholesomeness of the water. Bottled waters may show dangerous pollution originating from: 1. Contaminated wells or springs; 2. Dirty or unclean bottles; 3. Insanitary handling of the product.

Standard brands of bottled waters examined in our laboratory indicated that bacterial counts of such waters are sometimes excessively high following the bottling process due mainly to the preliminary washing process and insufficient rinsing.

To keep a check on the bottled water industry of Florida and promote greater cleanliness and care in bottling establishments Rule 69 of the State Board of Health was promulgated requiring all bottlers of water to secure from the State Board of Health a permit to bottle and sell water in Florida and further providing for the repulsion of such permits where deemed advisable.

Frequent inspections of bottling establishments over the state, strict observance of methods and practice employed and the study of modern practice throughout the country has placed at the disposal of bottlers a fund of

useful information. From time to time information sheets are issued extending the benefits of collected data.

Previous to granting a permit for the sale of bottled water the bottler must furnish complete and satisfactory detailed information under oath pertaining to his bottling establishment and water. All state bottling plants are visited. At the time of submitting the application for a permit samples of water as prepared for sale are submitted for analyses. Previous to granting permits particular attention is paid to: 1. Method of washing, cleaning and disinfecting all bottles, 2. Use of washing powders or disinfecting agents, 3. Facilities for washing, 4. Filling apparatus, 5. Filter or strainers, where used, 6. Cleanliness and neatness of establishment and employees, 7. Manner in which corks or caps are kept, 8. Method of draining bottles, 9. Protection from dirt and dust, 10. Protection of cap or cork.

In accordance with this rule all bottlers of waters now operating within or importing water into the State of Florida have made formal application for permits to sell their product.

Following are listed all permitted bottled waters. Waters may be added to or taken off this list from time to time.

Name of Water	Bottled at
1. Benscot Mineral	Austelle, Ga.
2. Buffalo Mineral	Buffalo Lithia Springs, Va.
3. Clysmic	Waukesha, Wis.
4. Coesa	Saratoga Springs, N. Y.
5. Distilled Water	St. Augustine, Fla.
6. Geyser	Saratoga Springs, N. Y.
7. Good Hope Mineral Water	Jacksonville, Fla.
8. Laconia Spring Water	The Weirs, N. H.
9. Mountain Valley Water	New York, N. Y.
10. Poland Water	South Poland, Me.
11. Polar Water	St. Augustine, Fla.
12. Polar Water	Jacksonville, Fla.
13. Polaris	Saratoga Springs, N. Y.
14. Pura Water	Jacksonville, Fla.

15. Purity Springs Water	Tampa, Fla.
16. Stafford Mineral Springs Water	Vossburg, Miss.
17. Still Rock	Waukesha, Wis.
18. Tate Springs Natural Mineral Water	Tate Springs, Tenn.
19. Tripure Water	Jacksonville, Fla.
20. Tripure Water	Miami, Fla.
21. Tripure Water	Tampa, Fla.
22. White Rock Mineral Water	Waukesha, Wis.
23. Celestins Vichy	Paris, France
24. Elder Springs Water	Sanford, Fla.
25. Ideal Springs Water	Tampa, Fla.
26. Mountain Valley Springs	Hot Springs, Ark.
27. Orange City Mineral Water	Orange City, Fla.
28. Perrier.	Paris, France.
29. Crystall Water	Daytona, Fla.
30. Polar Water	Miami, Fla.
31. Healing Springs Water	Hot Springs, Va.

As a direct result of the foregoing Rule No. 69 during the latter part of 1918, ninety (90) examinations were made of these waters as bottled and offered to the public for sale.

As a part of municipal and other sanitary surveys a number (34) of detailed chemical analyses were made on waters as follows:

Bradentown	2
Chattahoochee	19
Eustis	1
Jacksonville	2
Miami	3
Palatka	4
Quincy	2
South Jacksonville (U. S. S. B.)	1
Total	34

As a part of an efficiency test on the Riensch-Wurl sewage screen at Daytona a number of sewage analyses were also conducted, about eighteen.

During the hot summer months a research investigation was instituted into the hygiene of swimming pools. Occasionally during the past three years rumors had been dis-

seminated in various localities relative to the cleanliness of water used in the sanitary control of and the spread of certain infections via the swimming pool. These several questions arose in portions of the state where municipal or private pools had been established, notably at St. Petersburg, Monticello, Fort Pierce, Tampa and Jacksonville.

It is well known from numerous investigations that certain infections can be and have been transmitted through the medium of the swimming pool, mainly: 1. Intestinal infections like typhoid fever, dysentery, etc. 2. Eye and ear inflammations such as conjunctivitis, etc., and 3. Gonorrheal infections. Consequently it was deemed advisable to conduct a series of swimming pool investigations upon public pools in daily operation. As a result two hundred and seventy-two (272) water examinations were made from four pools and a bacteriological control maintained of them. One of these pools was located at the County Armory occupied by U. S. Guards guarding shipyards. The detailed results and conclusions will later be issued as a special bulletin.

Aside from the aforementioned laboratory investigations, special determinations were made to ascertain the effectiveness and efficiency of disinfecting agents for treating small quantities of water such as used by forces in the field, camping parties, autoists or hunters. Halazone, one of the trade disinfectants examined, is a direct product of the war. Examinations conducted in the laboratory indicate that it possesses all the qualities claimed by its makers.

LETTER OF TRANSMITTAL.

Jacksonville, Florida,  
February 15th, 1919.

Dr. W. H. COX,  
State Health Officer.

Dear Doctor:

I have the honor to transmit herewith the annual report of the Central Bureau of Vital Statistics for the year 1918, together with statistical tables for the calendar year 1917. It has been deemed wise not to make an effort to show any of the 1918 figures, with the exception of a few in connection with our comment on the epidemic of influenza, owing to the fact that our annual reports are required before all of the December birth and death certificates can be secured.

Respectfully,  
STEWART G. THOMPSON, D. P. H.,  
Director, Bureau of Vital Statistics.

# Report of the Central Bureau of Vital Statistics

by Stewart G. Thompson, D. P. H., Director.

---

## Part I.

1918

### INFLUENZA.

It will not be possible to make a complete report for 1918, as there has not been ample time for the preparation of statistical tables. However, for the benefit of those who are gathering data in connection with the influenza epidemic, the following is submitted from information available at this time.

The epidemic really started in Florida on the 26th of September and the effects of it were felt to the very last of December. During the four months, September, October, November and December, 4114 deaths were attributed to influenza and pneumonia (all forms): September 85; October 2712; November 934; and December 383.

The actual number of deaths and day of occurrence from September 1st to December 31st for 1918 as compared to the same period in 1917 will be found on Figure 1. The maximum number of deaths for any one day in September, 1917, was 3, and this number was passed on the 18th of September, 1918, with 4. On the 23rd there were 4 deaths; on the 26th 7; and on the 28th the same number with a sharp rise until the 10th of October when 112 deaths occurred, a slight drop to 105 deaths on the 11th with a substantial ascent to the 17th of October when 145 deaths actually occurred and which indicates the maximum number of deaths for any one day. Beginning with the 18th the curve descended to 140; on the 19th to 134; 20th, 130; 21st, 108; reaching 12 on November 29th which was the average number of daily deaths for the month of December.

Figure 2 shows the percentage of deaths from influenza and pneumonia at different age groups. 14 per cent of the total deaths from these diseases occurred among children under 5 years of age. 12.7 per cent of the white and 15.9 per cent of the colored deaths occurred in the same age group. The two age groups 5 to 9 and 10 to 14 were not so noticeably affected except that the colored per cent was much higher. At the ages 15 to 19 the per cent goes up reaching 14 at both 20 to 24 and 25 to 29 groups. The curve descends gradually until the ages of 45 to 49 for both white and colored. The white per cent, however, goes up to 5.2, while the colored continues to descend in the same general direction.

The per cent of the deaths was higher among the females up to and including the ages 20 to 24. After reaching the age of 25 the males showed a higher per cent up to the age of 45. This will be seen on Figure 3. On Figure 4 the sex by age groups is shown for white and colored. The white male reached 15.6 per cent at ages 25 to 29, while the colored male reached only 13.4. The colored female reached 15.2 at ages 20 to 24 and white female 15.05 per cent, showing uniformity of white and colored females and a wide deviation in males.

Table No. 1 shows the deaths from influenza and the pneumonias, September 1st to December 31st, 1918, by color, by county and month of occurrence.

Table No. 2 shows deaths from influenza and the pneumonias, September 1st to December 31st, 1918, by age, sex and color.

## EFFICIENCY OF REGISTRATION.

The number of death certificates filed for 1918 surpassed that for the previous year. This, however, may not be due to better registration as the so-called influenza is responsible for a large part of the difference. It is gratifying to know that the aggregate totals kept by months show an increase every month throughout the entire year.

From local registrars' reports and other recent observations, we have every reason to believe that very few deaths occur for which death certificates are not filed.

The faithful service rendered by the local registrars is very much appreciated and is worthy of mention at this time as it is only through their careful performance of duty that we can ever expect to have complete and correct records.

To stimulate registration a pamphlet "Care of the Baby" is to be sent to every new mother in the state during the coming year by the Bureau of Vital Statistics in co-operation with the U. S. Public Health Service. This pamphlet is considered one of the very best of its kind and it is hoped that the information given to the mothers in Florida may assist in the protection and proper development of the babies, who are to be the future citizens of our country.

## CERTIFIED COPIES OF CERTIFICATES.

The requests for certified copies have increased materially during the year. Many requests were made for birth certificates dating back seventeen or eighteen years, by young men who desired to establish officially the date of their birth, as definite information in many cases would have eliminated them from the draft.

Many other reasons were given for securing the official record including the following: Soldier to secure allowance for child; to enable child to enter school in Toronto,

Canada; passport for Red Cross work; entered army at age of fifteen years, record to be used to secure release at Camp Hancock; to secure increase in pay in navy; to be used in securing employment, certificate requested under Federal Child Labor Law; child adopted—contest for possession before courts in Key West; to collect Life Insurance; to be used as evidence in Court

A letter just received in today's mail reads in part: "Wish search made for record of the death of one-----, who has been away from here for many years and is said to have gone to Florida and perhaps died there. There is Life Insurance amounting to-----, which his heirs might as well have but shall first have to prove that he is actually dead."

The value of the records is very often not realized until the circumstances arise requiring evidence to establish the proof of a birth or death.

## PART 2.

1918.

### MORBIDITY.

The value of morbidity reports can hardly be estimated and we are looking forward to the time when every physician in the state will give hearty co-operation. The number of cases and deaths by counties have been shown in the "Health Notes" covering a period of nine months. This information is compiled by quarters and according to information received has been used to advantage by many of the health officers and others in the state. In addition to this a morbidity report has been issued each week to all the local health officers and newspapers throughout the state. This weekly report has been watched by many with interest, especially since the so-called influenza became so prevalent.

The morbidity reports for the year were not as complete as we had desired. While a few of the physicians are reporting cases faithfully, very many are not and for this reason the morbidity tables do not mean so much as health index in this state as in some others. However, we have every reason to believe that the physicians will co-operate when brought to a full realization of the need of reports so that more complete returns may be expected in the future.

The city health officers in a few of our cities have stimulated the reporting of notifiable diseases, as the reports to this Bureau will show. The district and local health officers should be commended for work done along this line and they certainly have a warm place in the hearts of those who are trying to put Florida on the map for morbidity.

During the year we received reports of 24,884 cases of notifiable diseases, as shown on the following table.

TABLE Showing Notifiable Diseases Reported, By Months, 1918.

Disease	Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.	Total

## PART 3.

1917.

## STATISTICAL REPORT.

For the calendar year 1917, 11,992 death and 17,921 birth certificates have been received, examined, classified, compiled, indexed alphabetically by the name of the decedent for deaths, and by the names of the father and mother for births. All original certificates have been arranged by date and by county in volumes of 500 each, ready for binding. This gives the people of Florida authentic records, more complete than ever before in its history, and as each year is added, they will increase in value. The particular value of these records and the uses that may be made of them would take a volume to recite, and will therefore be taken up at another time. The birth and death certificates were received and the punch cards made under the direction of Dr. F. L. Watkins, former Statistician of the Bureau.

## POPULATION.

The question of population is a somewhat difficult one in this state owing to seasonal fluctuation, industrial conditions and changes in boundary lines of counties, etc.

The population used as a basis for the calculation of 1917 rates has been estimated by the arithmetical method based on the 1910 U. S. Census and the State Census of 1915. Four counties were created since 1910 and seven counties show a decrease between 1910 and 1915. The population for these counties is therefore carried without change as given in the State Census of 1915. While an estimate of this kind in some instances does not tell the whole story it is the best obtainable for intercensal periods, and will therefore have to be our guide until the next census is taken.

Table No. 1 A shows the estimated population, total number of births and deaths (stillbirths excluded), birth rate and death rate per 1000 population for each county, by color. The map following appendix to Part 3 of this report will show the death rates graphically for each county. The death rate for the state is 12.2; for white 11.5 and for colored 13.2.

Of the fifty-two counties listed, thirty-one show a rate below that of the state. Whether this low rate is due to exceptionally good living conditions, a lack of complete reports, fluctuation in population, or some other cause, is a matter to be studied out for each particular community.

The birth rate for the state is 18.1; for white 21.2 and for colored 13.5 Table No. 15 is the same as No. 1 A for municipalities having a population of 1000 and over in 1915.

The following tables do not include stillbirths, either as births or as deaths. During the year there were reported to this Bureau 1193 stillbirths; 595 white and 598 colored.

Table No. 1 B shows a comparison of birth and death rates for the years 1915, 1916 and 1917, in municipalities having a population of 1000 and over in 1915. Many of these places are crowded with tourists during a part of the year and this fact should be taken into consideration when studying the rates.

Table No. 2 shows the total number of deaths (stillbirths excluded) by color and month of occurrence for each county.

Table No. 16 shows the same for cities.

Table No. 3 shows the total number of deaths (stillbirths excluded) by color, by age, and by sex for each county.

Table No. 17 shows the same for cities.

Table No. 4 shows the total number of deaths (stillbirths excluded) by color, sex, conjugal condition and nativity for each county.

Table No. 18 shows the same for cities.

In addition to the above this table shows the number of resident and non-resident deaths for each city. If decedents lived one year, or more, at place of death they were considered resident, and if less than one year, non-resident. While the death certificates did not all show the length of residence at place of death, the information given will be of sufficient value to be considered when studying the health conditions in any of the cities.

Table No. 5 shows the causes of death by color and by counties.

Table No. 19 shows the same for cities.

Table No. 6 shows the death rate per 100,000 of the estimated population for certain diseases by color and by counties.

Table No. 20 shows the same for cities.

### TYPHOID FEVER.

The total number of deaths reported during the year from typhoid fever was 221, of which 116 were white and 105 colored, the rate per hundred thousand population for the state being 22.4; white 19.4 and colored 27.1. Dade County had the highest rate which was 102. Inasmuch as this rate was based on only three deaths, being the total number reported from this county, the rate is not as significant as if based on a larger number. Out of the fifty-two counties, twenty-four had rates that exceeded the rate for the state. Nine counties did not have a single death reported from this disease, which are as follows: Baker, Brevard, Citrus, Clay, Jackson, Lake, Leon, Manatee and Pasco. Of the sixty-nine cities listed, twenty-seven had rates to exceed that of the state, while thirty-six cities did not have a single death reported and seventeen had only one reported death. More than half the deaths occurred between the ages of one and twenty-four, and eighty-two per cent before reaching the age of forty, which is evidence that it is a disease of youth. During the warm

season from May to October inclusive, sixty-three per cent of the deaths occurred. Twenty-nine deaths occurred during the month of June and eight during December, representing the largest and smallest number of deaths reported for single months. Sixty-eight per cent of the population is rural and fifty-nine per cent of the deaths occurred in this class. The rural rate, per hundred thousand population, for the state is 19.5; white 17.3, colored 22.9.

#### MALARIA.

Malaria was responsible for 273 deaths; 158 white and 115 colored. The rate, per hundred thousand population, for the state is 27.6; white 26.3; colored 29.6. The mortality from malaria is very high among the rural population. Eighty-one per cent of the deaths occurred in the rural districts, making a rural rate of 32.8 per one hundred thousand population.

The following counties had no deaths reported from this disease: Broward, Lee, Monroe, Nassau and St. Lucie.

#### SMALLPOX.

Only one death reported from this disease during the year.

#### MEASLES.

This disease caused 170 deaths; 101 white and 69 colored, making a rate of 17.2 per hundred thousand population, for the state, 16.8 white and 17.8 colored. Many parents do not give this disease the serious consideration it deserves, but when we see that twenty-eight more deaths were caused by measles during 1917 than from scarlet fever, whooping cough and diphtheria combined, it is certainly time to take warning.

#### SCARLET FEVER.

Two deaths were caused from scarlet fever during the year.

#### WHOOPING COUGH.

This disease was responsible for 49 deaths, 30 white and 19 colored. All deaths occurred among children under ten years of age, except one which was a white female over eighty years. The rate is 5.0 per one hundred thousand population. Only five counties show more than two deaths from this disease.

#### DIPHTHERIA.

Ninety-two deaths were caused by this disease, 70 white and 22 colored. The rate per hundred thousand population is 9.3 for the state; 11.7 white and 5.7 colored. Creighton states that "Diphtheria is the only epidemic condition, besides whooping cough, which is more fatal to females than males in proportion to the number of each sex living." It is interesting to note that for the state there were 46 male and 46 female deaths. Of the 22 colored, 15 were male and 7 female, while for the white there were 31 male and 39 female. Fifty-eight per cent of all the deaths occurred between September and December inclusive. Only one death occurred among our foreign-born population.

#### INFLUENZA.

The number of deaths from this disease was 170 for the state, 107 white and 63 colored. The rate per hundred thousand population is 17.2 for the state; white 17.8, colored 16.2. Twelve counties did not report deaths from this disease.

**RABIES.**

One death occurred during August from this disease. It was a colored boy seven years of age.

**PELLAGRA.**

Two hundred and eighteen deaths were certified from this disease, making a rate for the state of 22.1 per hundred thousand population; 17.5 white and 29.1 colored. It appears more fatal among the females, showing 161 as compared to 57 males.

**TUBERCULOSIS.**

The number of deaths certified from all forms of this disease is 1085, of which 472 are white and 613 colored. The rate is 110 per hundred thousand population; 78.7 white and 158 colored. Last year the United States Registration area showed a rate of 141.6, which is higher than either the state or white rate in Florida. Tuberculosis of the lungs was responsible for 986 of these deaths, which is ninety-one percent. Other forms are as follows: Acute miliary 11; tuberculous meningitis 8; abdominal 36; Pott's disease 1; white swellings 2; tuberculosis other organs 33; disseminated 8. Every county except one certified a death from this disease. The average number of deaths each month was 90, the highest for any one month was 95 in January and the lowest 66 in September.

**SYPHILIS.**

The rates have not been shown for each county and city, but those who are interested will find the number of deaths by counties and cities in Tables Nos. 5 and 19. This disease was responsible for 206 deaths, of which 39 were white and 167 colored. The rate for the state is 20.9 per hundred thousand population; 6.5 white and 43.1 colored.

Seventy percent of the deaths were male and seven percent were children under one year of age, although the highest number of deaths occurred between the ages of forty and forty-four.

**CANCER.**

Cancer, all forms, was responsible for 378 deaths during the year; 298 white and 80 colored. The rate is 38.2 per hundred thousand population for the state, 49.6 white and 20.6 colored. Forty-six percent of the deaths from this disease occurred between the ages of fifty and sixty-nine. Only five counties did not certify deaths from cancer, which are as follows: Hernando, Liberty, Okaloosa, Taylor and Wakulla.

**ORGANIC HEART DISEASE.**

Heart disease caused 651 deaths in the state, making a rate of 65.9 per hundred thousand population. Four hundred and fourteen of the deaths occurred among the white and 237 colored, making a white rate of 69.0 and colored 61.1.

**PNEUMONIA.**

Pneumonia and broncho-pneumonia caused 652 deaths, of which 358 were white and 294 colored. The rate for this disease (all forms) is 66.0 per hundred thousand population; the white 59.7 and the colored 75.9. Every county except Baker, Hernando and Pasco certified deaths from this disease. Twenty-three percent of the deaths occurred among children under five years of age. The three months showing the highest number of deaths were December, January and February, total of which is 238, representing 37 percent of all deaths from this disease.

**DIARRHEA AND ENTERITIS  
UNDER TWO YEARS.**

This disease alone cost the state of Florida 616 lives of children under two years of age, the rate being 62.6

per hundred thousand population for the state, 71.5 white and 48.2 colored. Of the 616 deaths of these children, 429 were white and 187 colored.

### BRIGHT'S DISEASE.

This disease is another that is general over the state, as only two counties, Calhoun and Liberty, did not certify deaths from this cause during the year. Chronic nephritis or Bright's disease was responsible for 807 deaths, of which 489 were white and 318 colored. The rate for the state is 81.6 per hundred thousand population; the white, 81.5, and the colored, 82.2. Seventy-two per cent of the deaths occurred after reaching the age of fifty.

Table No. 7 shows the causes of death by color, by age and by sex.

Table No. 8 shows the causes of death by nativity, conjugal condition and color.

Table No. 9 shows causes of death by color and month of occurrence.

Table No. 10 shows the number of births and deaths (stillbirths excluded), excess of births over deaths, and births per 100 deaths, by color, for each county.

Table No. 11 shows births (stillbirths excluded), by color, by months, for each county.

Table No. 21 shows the same for cities.

Table No. 12 shows the number of births (stillbirths excluded), deaths of children under one year and infant mortality rate by color for each county.

Table No. 22 shows the same for cities.

The infant mortality rate for the state is 106; white 86 and colored 155. The infant mortality rate is based on the number of deaths of infants under one year of age per the number of living births reported. During the year, 1897 deaths of infants under one year occurred, of which 1087 were white and 810 colored. The month of occur-

rence did not show a marked variance, as the average was 15.7, the highest in any single month was 190 in May, and the lowest 125 in December. Diseases that in the majority of cases caused deaths were as follows: Malaria 24; measles 28; whooping cough 28; diphtheria 9; influenza 21; dysentery 48; tetanus 20; syphilis 15; meningitis 11; convulsions 24; acute bronchitis 22; pneumonia 126; enteritis 345 and diseases peculiar to early infancy 678. The map following appendix to Part 3 of this report shows the infant mortality rates by counties.

Table No. 13 shows the number of births (stillbirths excluded), by sex, plural, nativity of father and mother, whether attended by physician or midwife, and by color for each county.

Table No. 23 shows the same for cities.

Of the 17,921 births reported, 10,253 were attended by physicians, 7,661 by midwives and one unknown attendant. One thousand nine hundred and sixty-eight show foreign fathers and 1,624 show foreign mothers. Fifty-one per cent were male and forty-nine female.

During the year 417 twins and 7 triplets were born alive. When studying this table, note that the twins and triplets listed were born alive, stillbirths having been excluded, and represent individual births and not sets of twins or triplets.

Table No. 14 shows number of children (stillbirths excluded) born to each mother, by color and by counties.

Table No. 24 shows the same for cities.

Information given on birth certificates shows that three colored mothers in Florida gave birth to 20 children each. The highest number of children born to any white mother was 18. The average number born to each mother is 3.4; white 3.3 and colored 3.8. It will be interesting to study this table for the different communities, as some parts of the state differ widely from others as to nationality, color, etc.

APPENDIX TO PART 3

# Statistical Tables

1917

TABLE No. 1 A. Showing Estimated Population, Births and Deaths (Still-births excluded), Birth Rate and Death Rate per 1000 Population, By Color, By Counties, 1917.

COUNTIES	Population	Births	Birth Rate	Deaths	Death Rate
State (Total)-----	988,461	17,921	18.1	11,992	12.2
